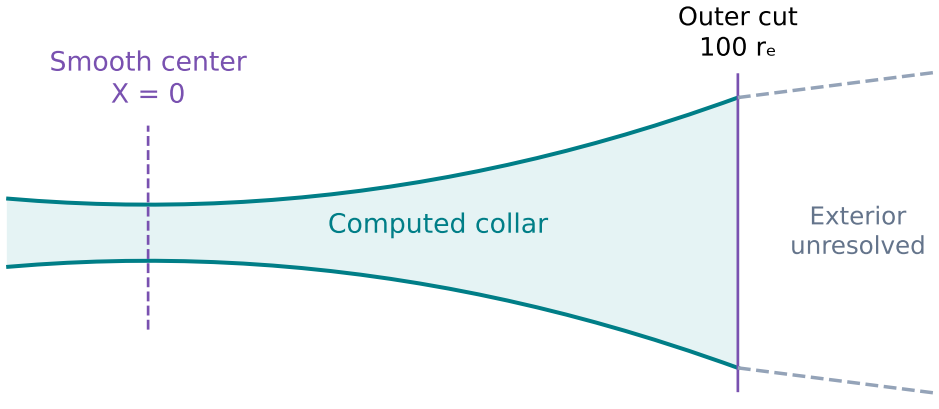
Smooth center fixed; the exterior still needs quantum terms

Assumed static throat • Reflection-even sector • Target $\alpha = 10^{-9}$ • No material or machine established

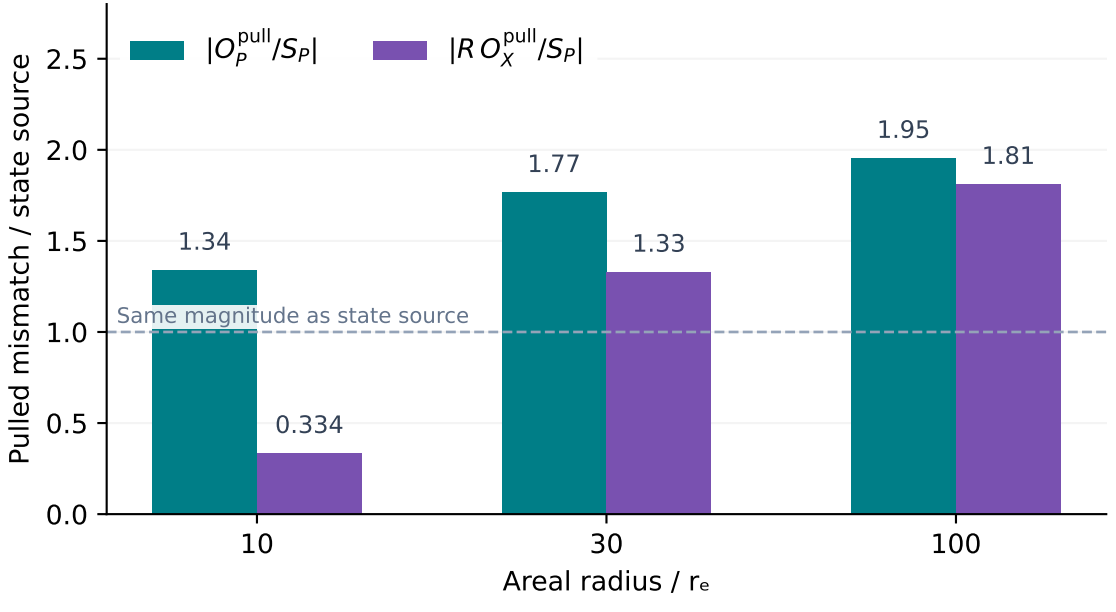
A. Center symmetry supplies an inner condition



Theoretical geometry; schematic, not to scale

X = 0 follows from the chosen reflection symmetry.
The physical exterior response remains an unknown input.

B. Pulled operator mismatch vs state forcing



O includes the radial-coordinate pullback.
Both ratios use nonzero S_P; the X mismatch is weighted by R.

Growing-only classical input: the operator mismatch is not a full forced residual, global solution error or instability test.

Physical matching, exterior quantum response, complete-loop state and dynamic stability remain unresolved.

No constructed stable medium or 13 → 12 Sep 2027 passage demonstrated.
