Large stress does not imply a large equation residual

Conditional reconstruction • Sampled center events only • Four initial loops • $\alpha = 10^{-9}$

A. Center probe in an assumed throat

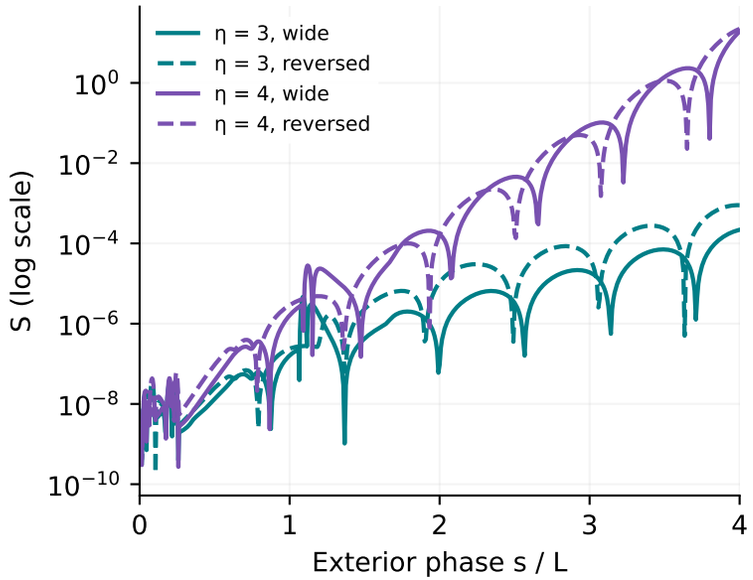

Specified Polyakov closure

Sampled absolute maxima

Mixed	6.67e-10
Static mixed calibration	6.67e-10
Angular	1.95e-09
Angular pulse − static	3.04e-09

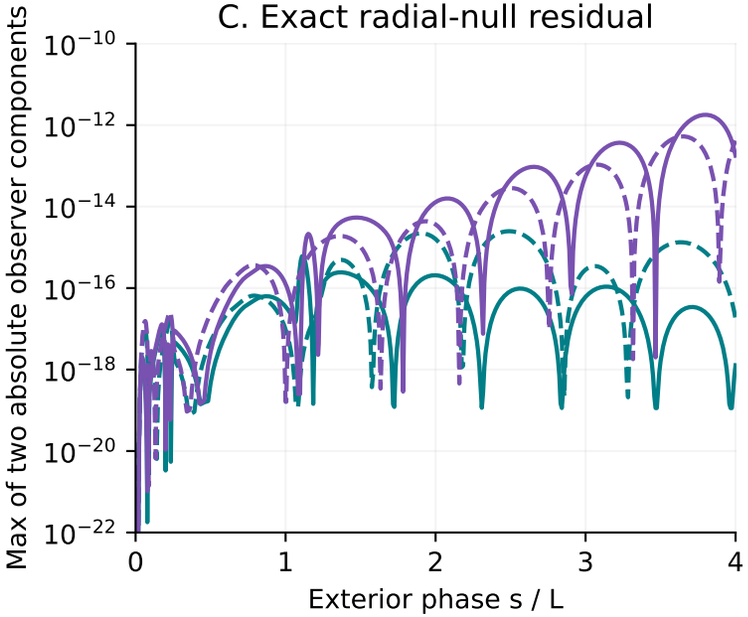

Mixed defect is already present in the static calibration.

B. Center stress diagnostic S

Largest sampled S: 22.21; no validity cutoff imposed.

C. Exact radial-null residual

Largest sampled residual: 1.791e-12.
Near-zero start below plotted range; zero omitted.

Residuals are dimensionless $r_e^2(G - 8\pi GT)$ with specified observer contractions, not metric-error percentages.

Reconstructed metric and specified matter closure only; residuals are evaluated, not solved away. No global stability proof.

No constructed medium or 13 → 12 Sep 2027 passage established.
