Coupled throat response; a receiver that slows but does not capture

Separate theoretical tests: leading classical gravity and prescribed static electric charges

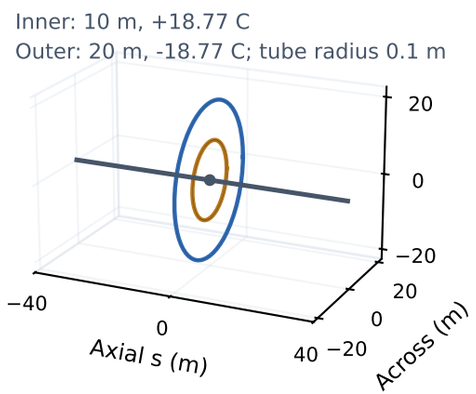

A. Field and geometry are now coupled

B. An illustrative static dipole response

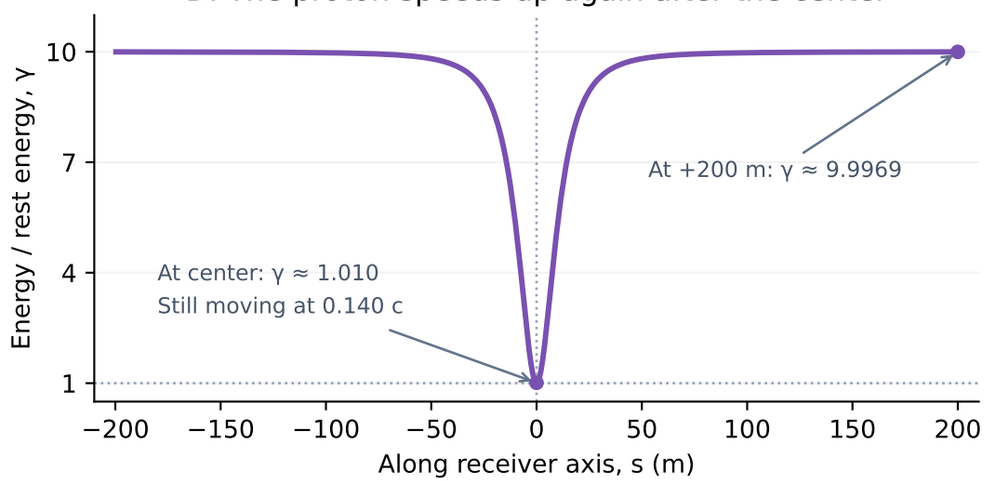

C. Static receiver rings and the local proton path

Prescribed charged surfaces; field present from t = 0

Charge response of a metal electrode is not solved

D. The proton speeds up again after the center

Gravity: a leading classical scalar result. Actual mouths, the quantum source and nonlinear stability remain unresolved.

Receiver: fixed electric charges act along the full trajectory. Material response, stopping and a clock reunion are not demonstrated.

13 → 12 Sep 2027: unproved. **Forward time dilation is supported; a complete one-day journey remains untested.**
