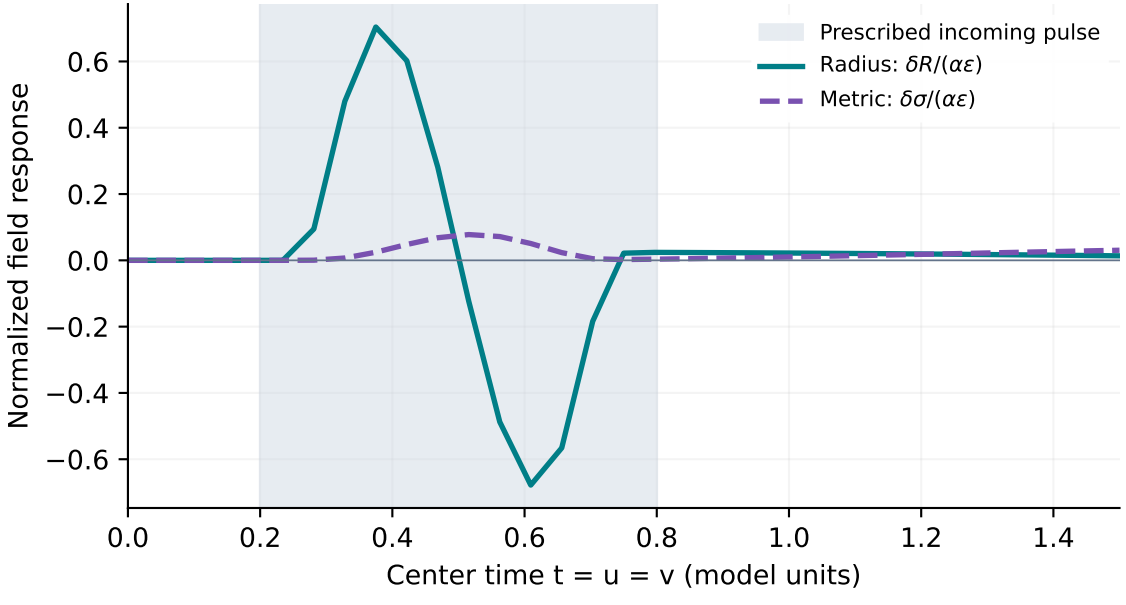
A first local coupled geometry response

Two independent diagnostics • No matched physical mouth clocks

A. Local linear benchmark



αε = 10^{-12}; curves show fields, not area.
Local linear response; no nonlinear finite-amplitude test.

B. Conditional exit sensitivity

Different state: η = 4; completed side-0, phase-0 exit

	Wide	Reversed
Receiving clock rate	0.51814	0.07973
Timing gain = 1 / rate	1.92998	12.54280
Assumed combined phase error: ±0.001		
Exit shift lower bound	-0.00192811	-0.01244750
Exit shift upper bound	+0.00193185	+0.01263998

Exit shifts are in exterior optical units, not seconds.
An earlier exit shift is not a past return.

No mouth-matching calculation connects A to B. The phase bound in B is assumed, not predicted by A.

Finite local region and specified Polyakov matter; exterior completion, physical sources and stability remain unresolved.

No constructed medium or 13 → 12 Sep 2027 passage established.
