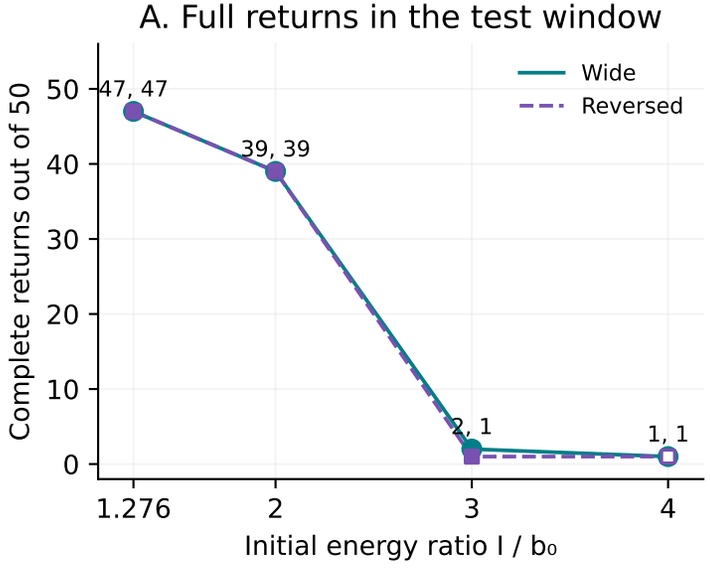
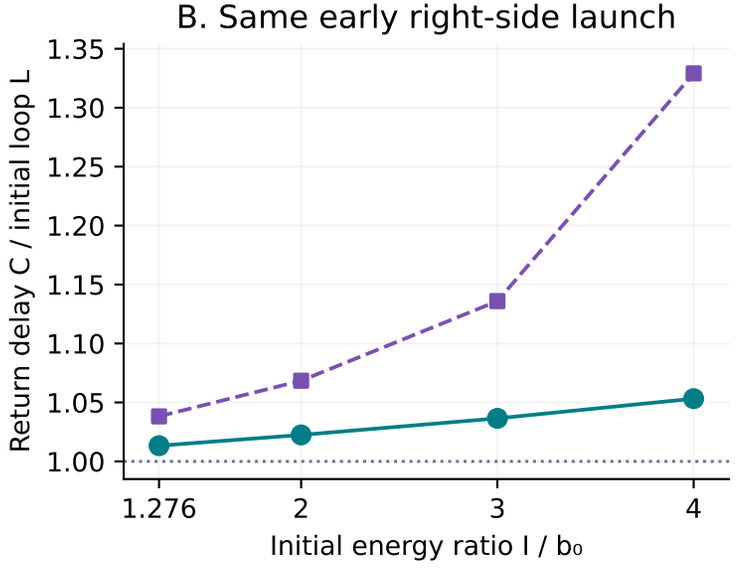
Energy sweep: return counts fall as source strength grows

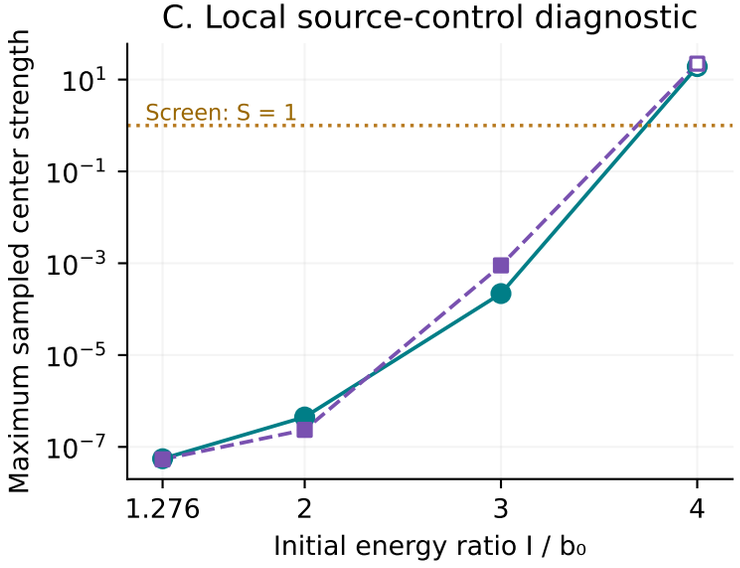
Fixed exterior delay D = 1.2 • 50 matched launches per state • Declared α = 10^{-9}



Labels: wide, reversed. Missing exits are censored.



Launch phase 0; before sampled order-one onset.
Dotted line: unperturbed loop = 1; axis is enlarged.



Observer-dependent screen, not a 4D residual test.
Small center values alone do not prove stability.

Open late-run points fail the assumed weak-source screen; those late counts remain formal model outputs.

All compared early return delays remain positive. Counts concern a finite window; times use optical model units.

No 4D source, stable medium or 13 → 12 Sep 2027 passage established.
