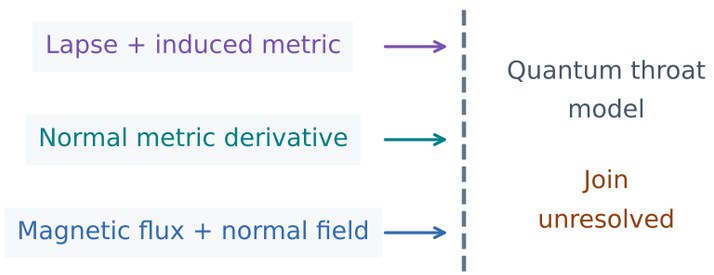
Finite boundary data and a receiver current without edge divergence

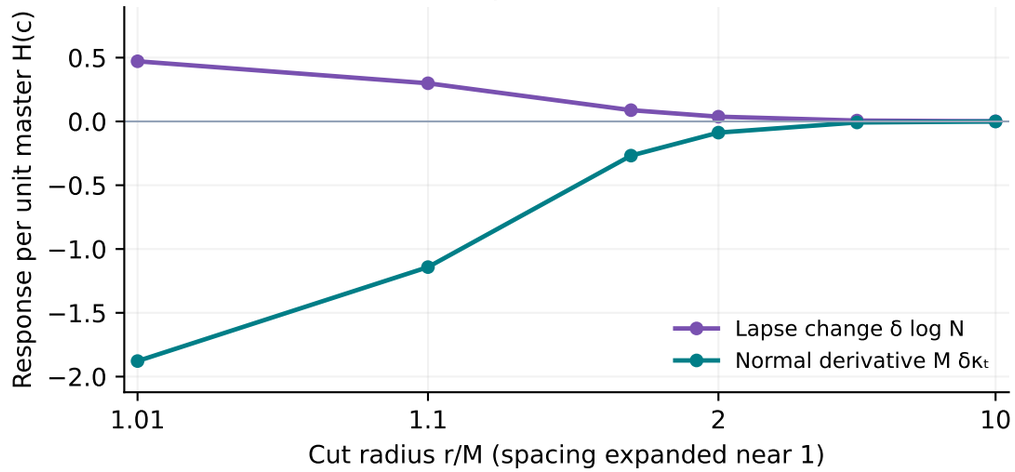
Static exterior reconstruction and prescribed-source tests • no joined quantum throat or built medium

A. The finite exterior boundary is reconstructed



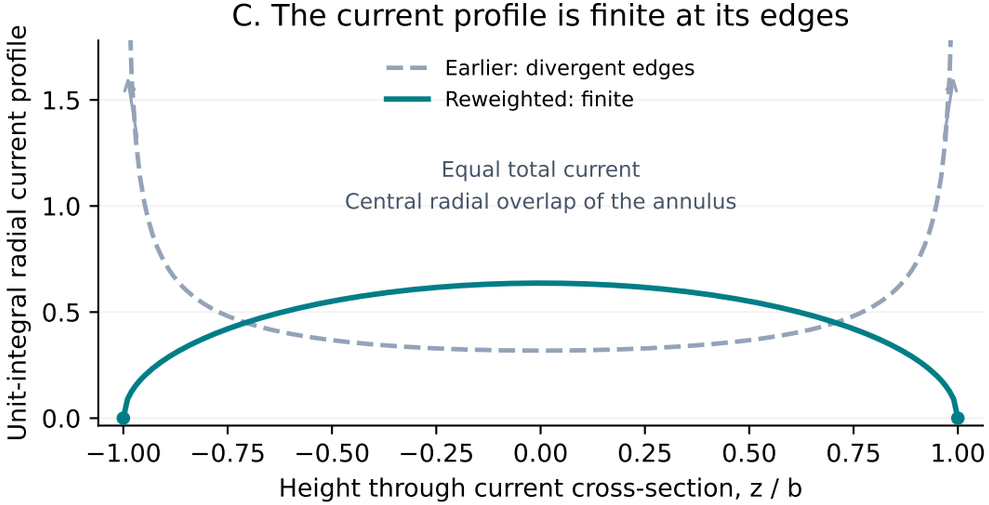
Boundary data, not a created tunnel or material

B. Linear response at six finite cuts

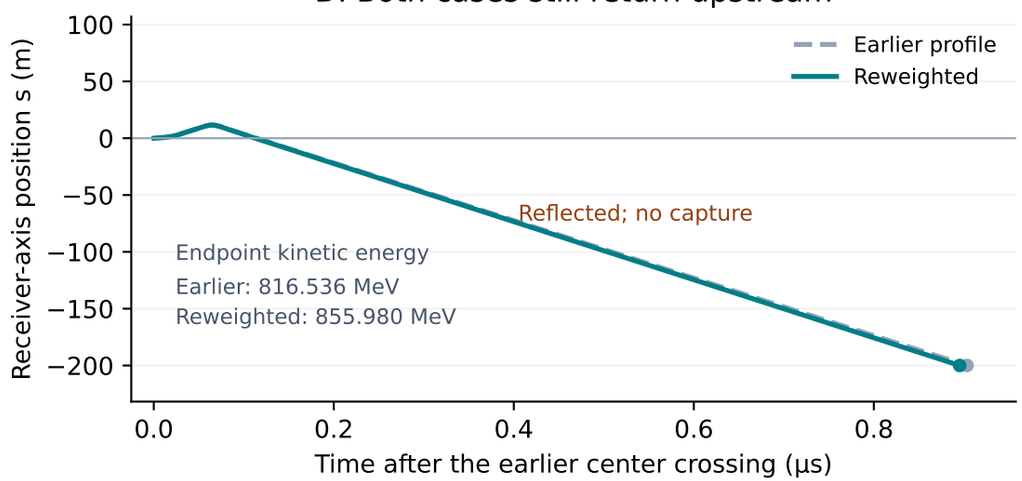


Each cut: H(c) = 1, I(c) = 0; no surface displacement or relabeling
Normal points toward +r; these are linear coefficients

C. The current profile is finite at its edges



D. Both cases still return upstream



Boundary: direct linear Einstein–Maxwell and surface-gauge checks pass. The quantum-supported background and its physical junction remain open.

Receiver: bounded prescribed current density is a mathematical improvement; conductor response, source preparation and permanent capture remain unproved.

13 → 12 Sep 2027: unproved. **Forward time dilation is supported; a complete one-day journey remains untested.**
