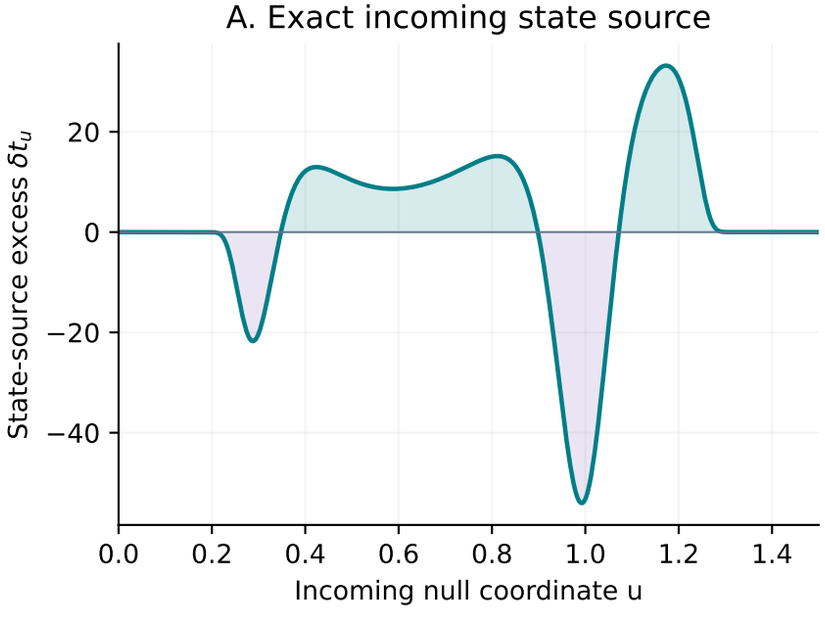
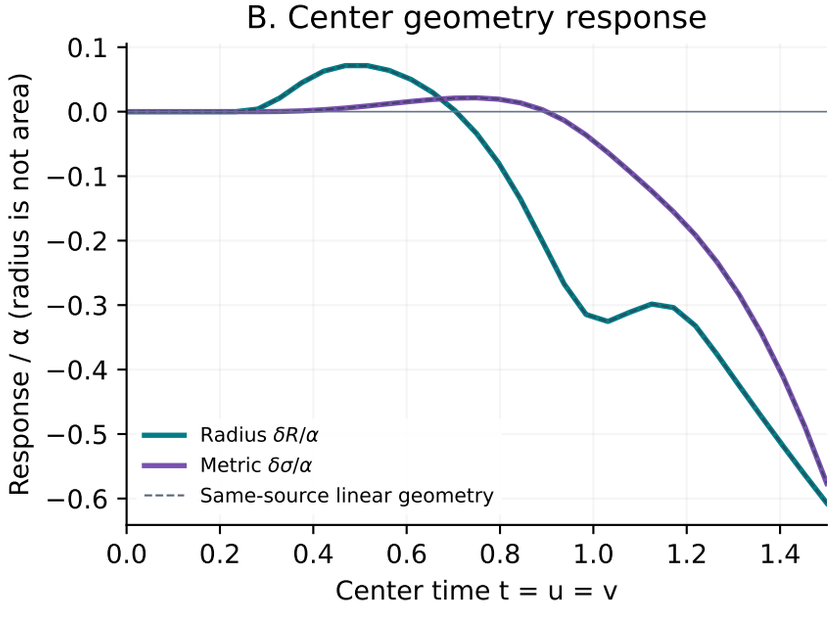
A finite-energy pulse with coupled geometry response

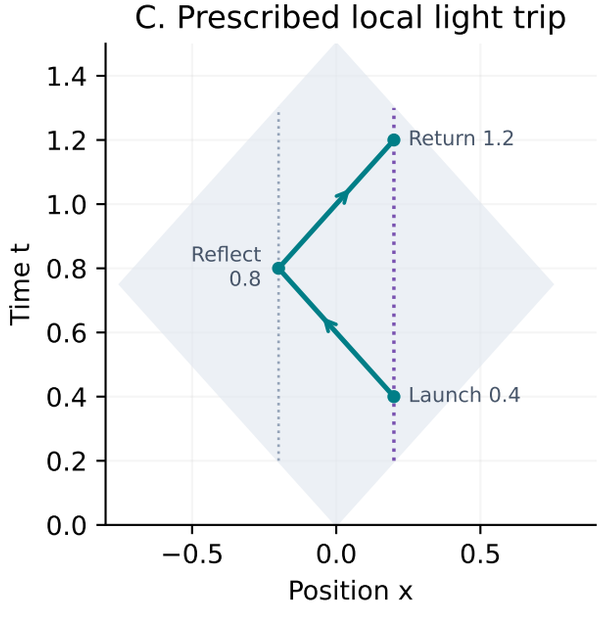
Conditional Einstein–Maxwell–Polyakov model • α = 10^{-9} • A pre-existing throat is assumed



Integrated excess = 3.438 > 0.
Model normalization; local lobes may be negative.



Full and linear curves overlap at this scale.
Their small difference is below the mesh difference.



Static duration: 0.816271 r_e/c
Change: -5.568e-11 r_e/c; total stays positive.

This evolves an assumed local throat; it does not form one from ordinary space or supply a physical preparation method.

C uses one prescribed emitter clock and an ideal reflection. The trip is causal by construction; no physical mouth matching or global stability.

No constructed medium or 13 → 12 Sep 2027 passage established.
