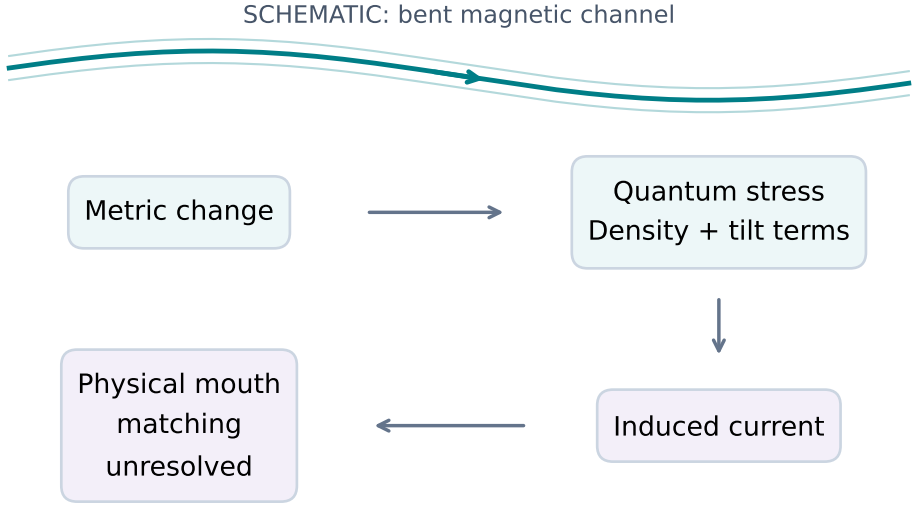
Quantum channel stress and current are now linked

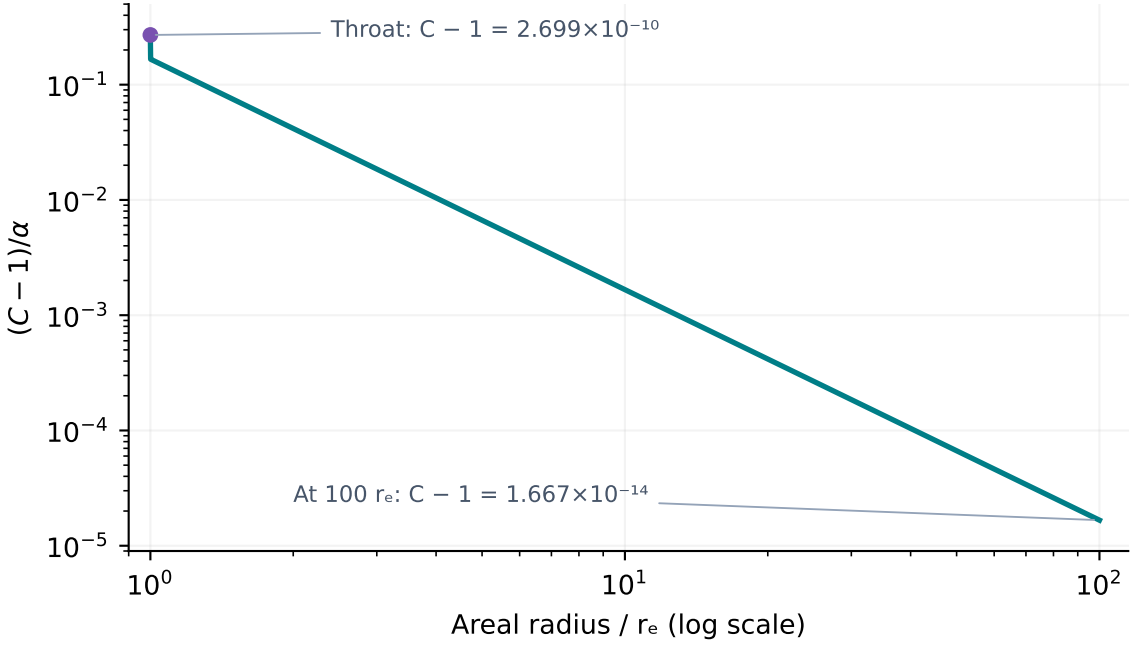
Derived local channel equations • Assumed throat and finite static exterior • $\alpha = 10^{-9}$

A. Field and source must respond together



Action variation and both conservation identities pass.
This diagram represents equations, not a material recipe.

B. Positive correction to the field equation



C > 1 avoids this static magnetic degeneracy only.
It does not establish dynamic or global stability.

Seed test uses $\alpha = 10^{-3}$. Full geometry, complete-loop state, physical matching and stability remain unresolved.

No stable medium or 13 → 12 Sep 2027 passage established.
