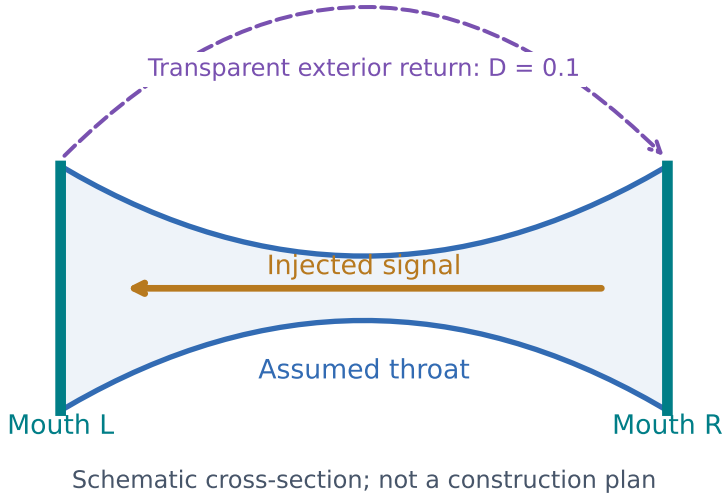
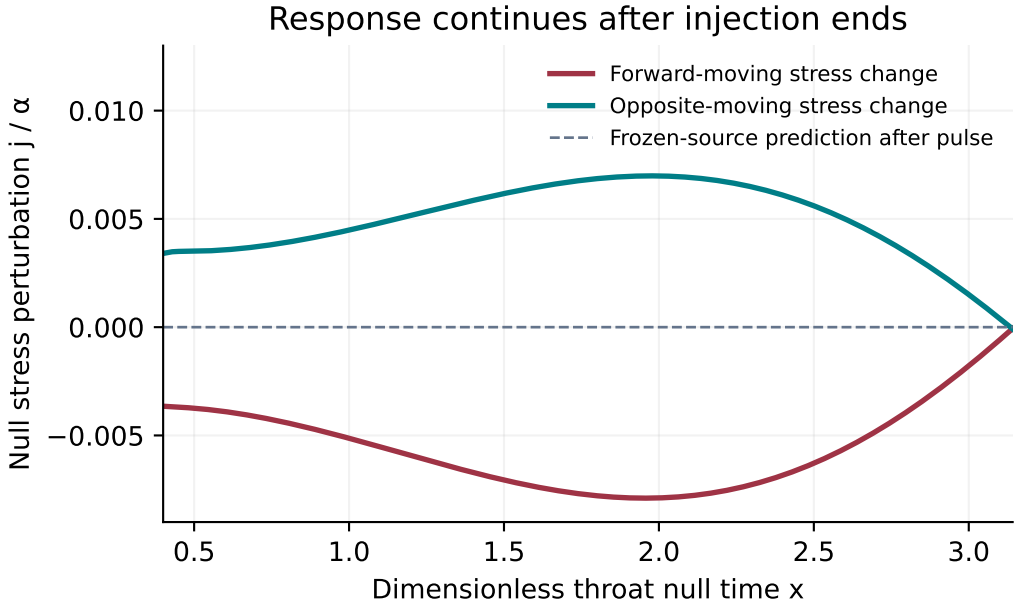
Wormhole model: the supporting quantum stress responds

First-interval calculation with moving mouth clocks and a finite exterior delay



Schematic cross-section; not a construction plan



The field response, mouth clocks and throat-area change now satisfy the same reduced equations. Independent calculations agree.

Assumptions: fixed exterior geometry, one common delay and linear quantum mean-field response. No full-return stability test yet.

13 September 2027 → 12 September 2027: still unproved. This improves the model, not evidence of an operating time machine.
