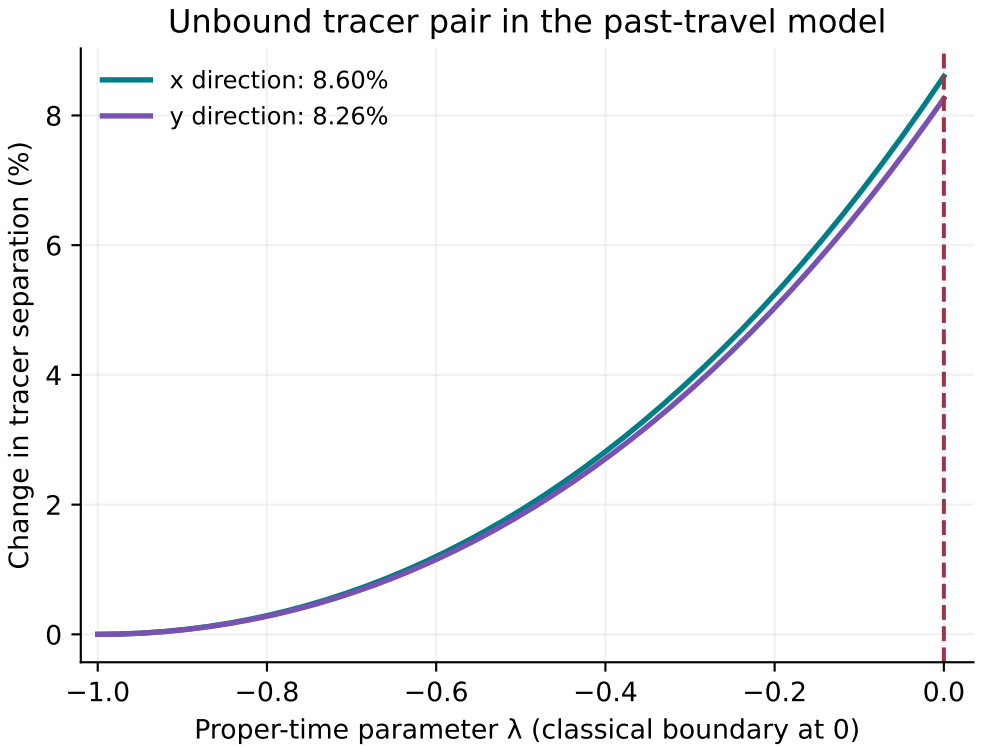
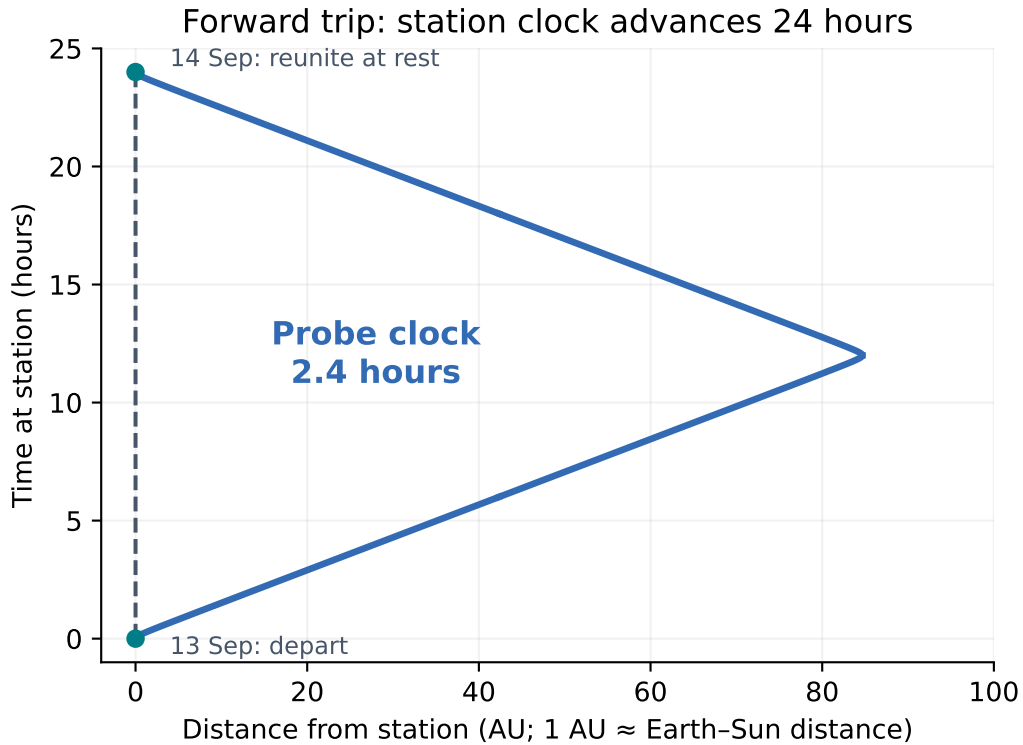
Tiny payload first: what the calculations establish

Past: a test on an assumed geometry • Future: a route using ordinary spacetime





Left: formal 1 μm rescaling gives +86 nm / +83 nm. Valid as a small-separation approximation only; no bonded-grain model.

Right: prescribed acceleration ≈ 63,700g; peak speed ≈ 0.999753c. Forces, propulsion and payload survival remain unmodelled.

Past route: no validated crossing. Forward route: exact ideal motion using experimentally supported time dilation.

13 → 12 September 2027: unproved. **13 → 14 September: less probe time is physically allowed; this flight is not demonstrated.**
