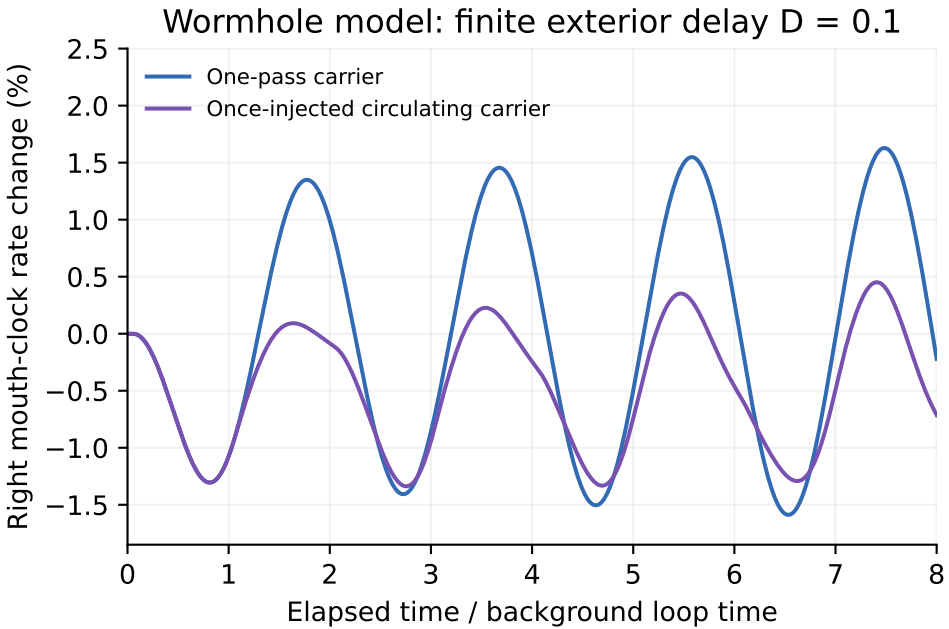
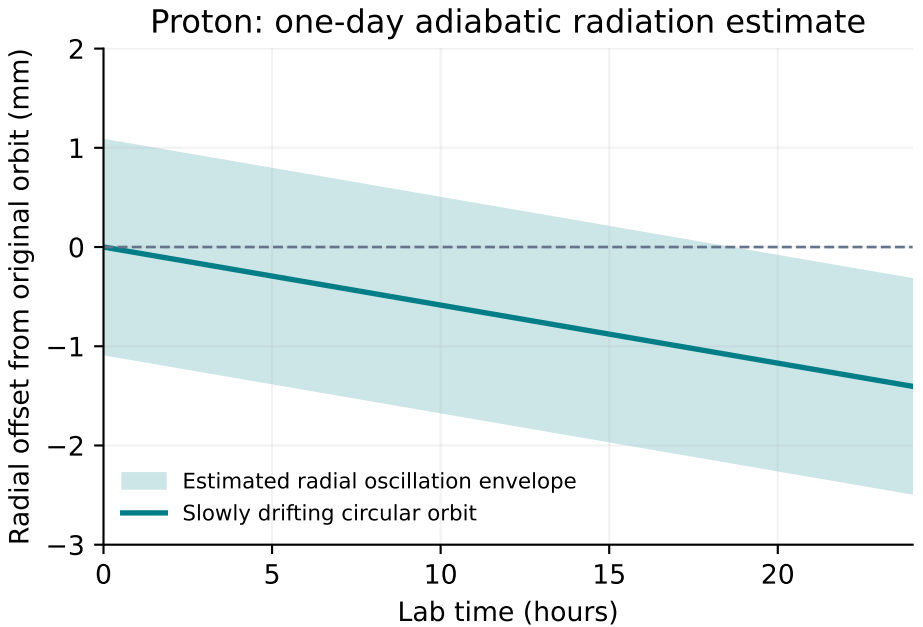
Next checks: complete returns and radiation losses

Our reduced calculations • finite intervals and stated approximations





Left: all sampled clock/ray rates and return-time gaps remain positive. This is not a proof of nonlinear stability or past travel.

Right: orbit centre shifts inward 1.40 mm; estimated maximum radial excursion is 2.48 mm. Chosen tube limits are ±10 mm.

Radiation changes the conserved quantities used in the earlier confinement proof. These envelopes require adiabatic and linear assumptions.

13 → 12 Sep 2027: unproved. **Forward example: 24 lab hours ≈ 2 h 24 min 0.116 s of proton proper time in this loss model.**
