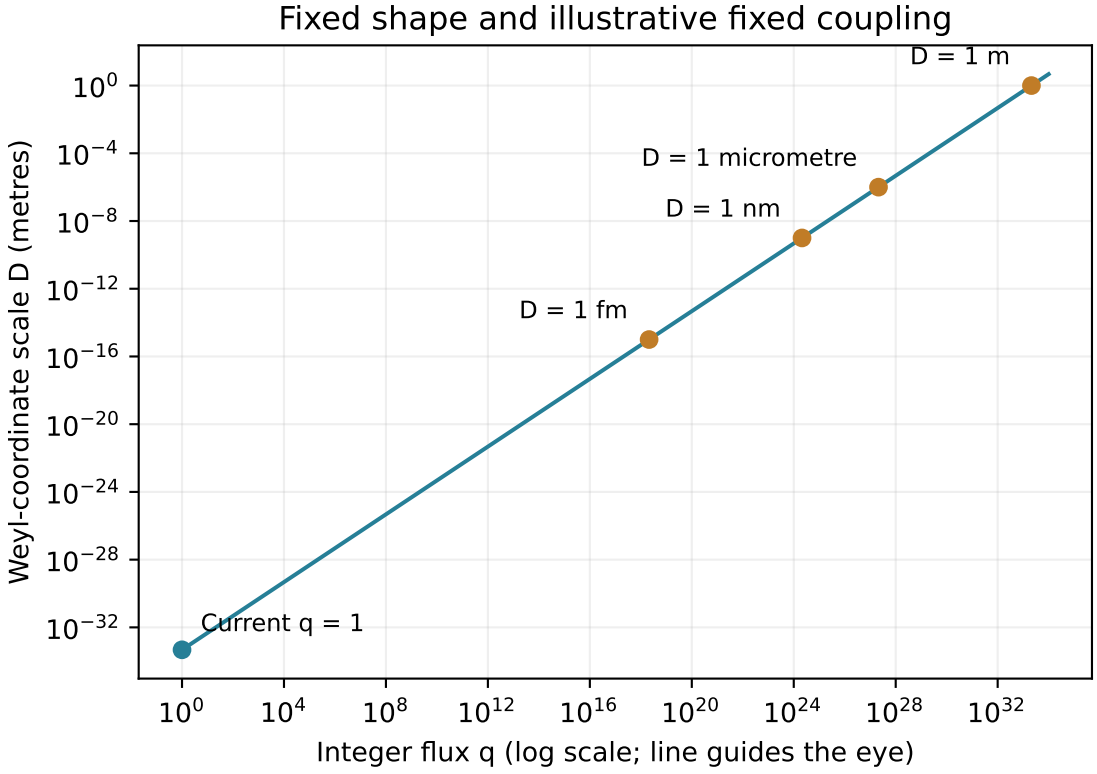
The present field calculation cannot simply be enlarged to human size



What the normalization fixes

D / Planck length = 5 |q| / (2 sqrt(alpha_R))

For q = 1 and alpha_R = 0.00729735:
D = 29.27 Planck lengths
Central areal radius = 6.66 Planck lengths

To change the size:
change q, change the coupling, or change the shape.
Each changes the physical model being tested.

No quantum source value or support bound is supplied.

Low-energy alpha is used only as a fixed illustrative value; no running-coupling or electron model is asserted.
