A localized spherical packet in the coupled linear theory
Negative core and positive surroundings
Linear stress / cutoff^4 (x 100,000)
Initial radius / packet width
Outward null stress
Inward null stress
Energy density
The source dilutes as the packet expands
Central null stress / cutoff^4 (x 100,000)
Expansion time H t
Linear compactness only
Excess compactness (x 1,000,000)
Comoving radius / initial width
H t = 0
H t = 1
H t = 3
First-order packet: compactness needs nonlinear validation at this amplitude. No spatial throat, constructed material or backward passage.
