Where the phase contrast responds to a local clock-rate change

Prescribed geometry · Three compact test regions · One retained quantum sector

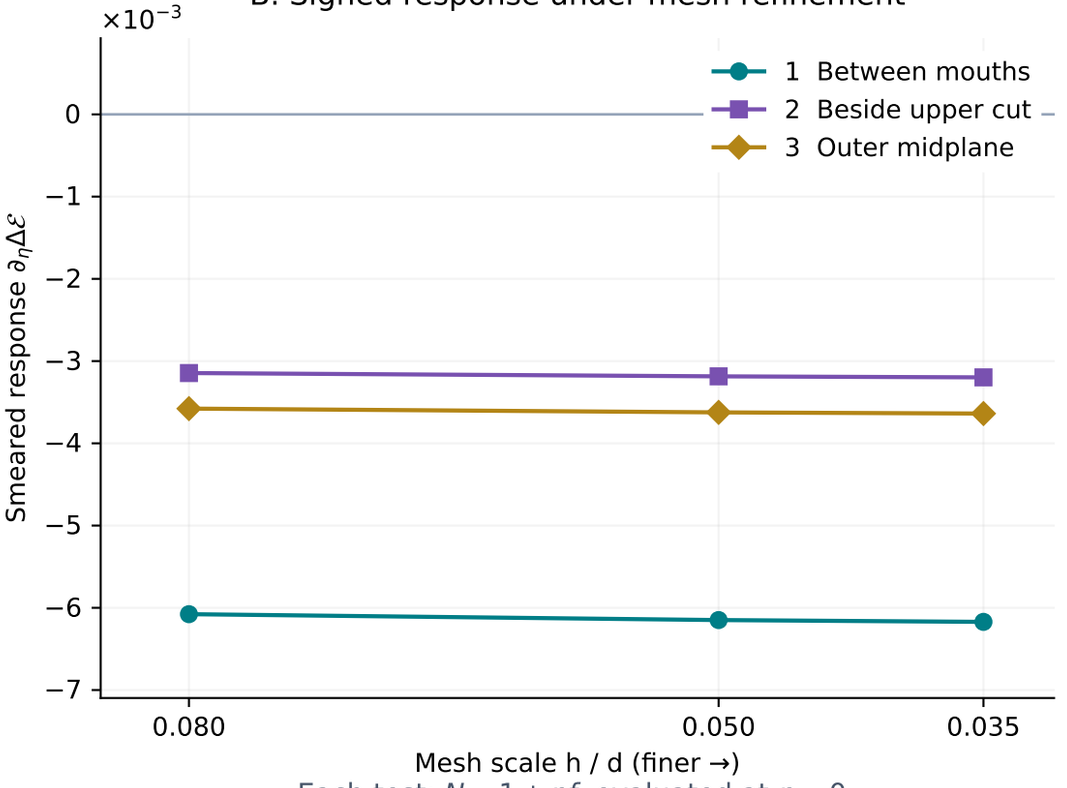

A. Actual meridional test supports

Off-axis disks rotate into tori. Shading is the test weight.

Prescribed throat: required support is not supplied.

B. Signed response under mesh refinement

Each test: $N = 1 + \eta f$, evaluated at $\eta = 0$.

Raw responses; no division by region volume.

Window 1e-06 ≤ κd ≤ 12; largest latest mesh change 2.2e-05, quadrature change 2.8e-10. Normalized model units: $\hbar$ = c = d = 1.

Signs describe a phase difference, not absolute negative energy or radial NEC. Continuum and frequency-tail bounds remain unresolved.

The geometry remains prescribed and its source incomplete. No stable medium or 13 Sep 2027 → 12 Sep 2027 passage demonstrated.
