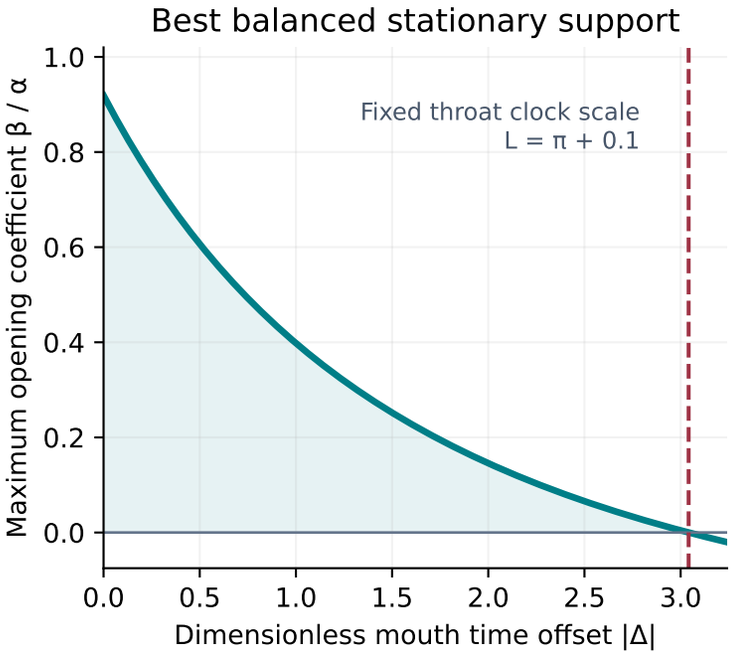
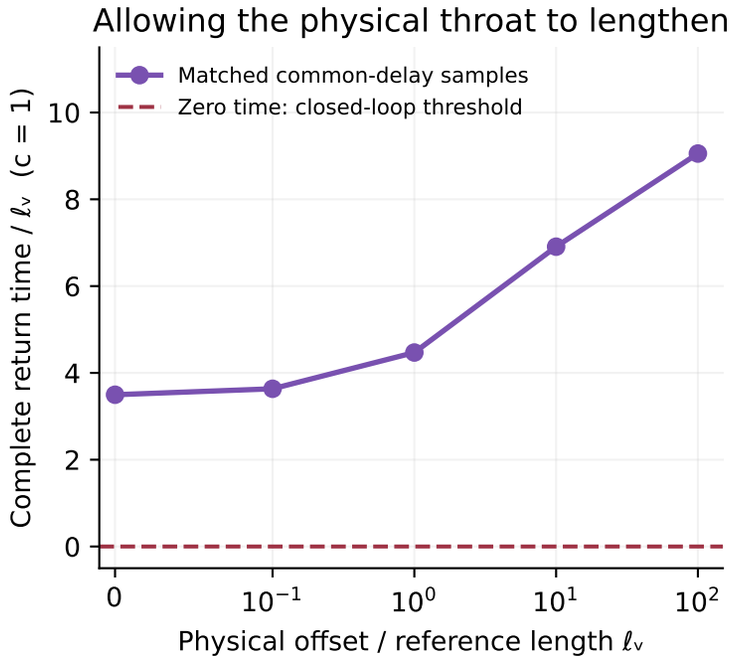
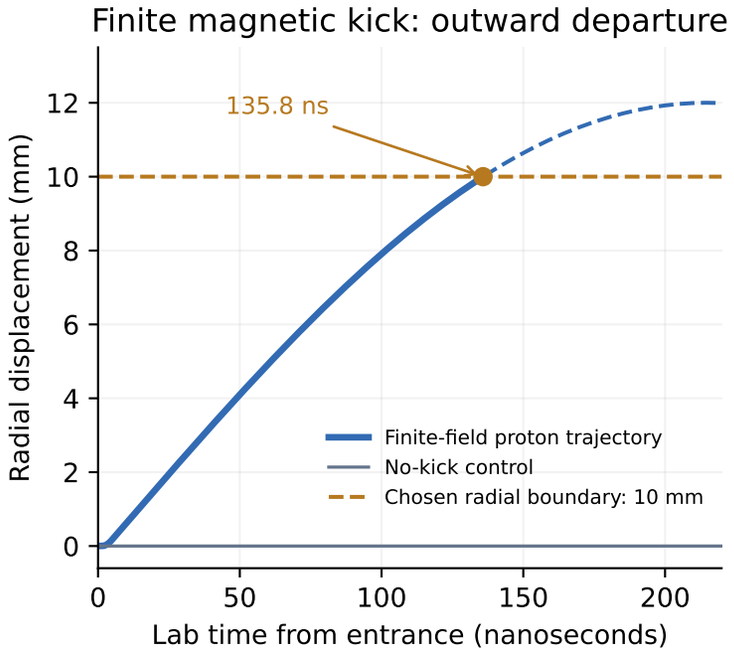
Balanced throat stresses still give forward returns; a finite kick starts an exit

Checked mathematical models • stationary quantum source and a short proton trajectory







Past: neutral fermion excitations can balance the mean stress, but weaken its support. Changing the matched throat length keeps the return positive.

Future: the finite fringe field sends a nominal proton across 1 cm. Dashed continuation still uses the ideal ring field; a real outgoing region is missing.

Next: earliest-arrival and total-stress checks for a driven throat; a septum and matched outgoing field for the proton. No construction is demonstrated.

13 → 12 Sep 2027: unproved. **13 → 14 Sep: supported time dilation; complete entry, storage and exit remain to be joined.**
