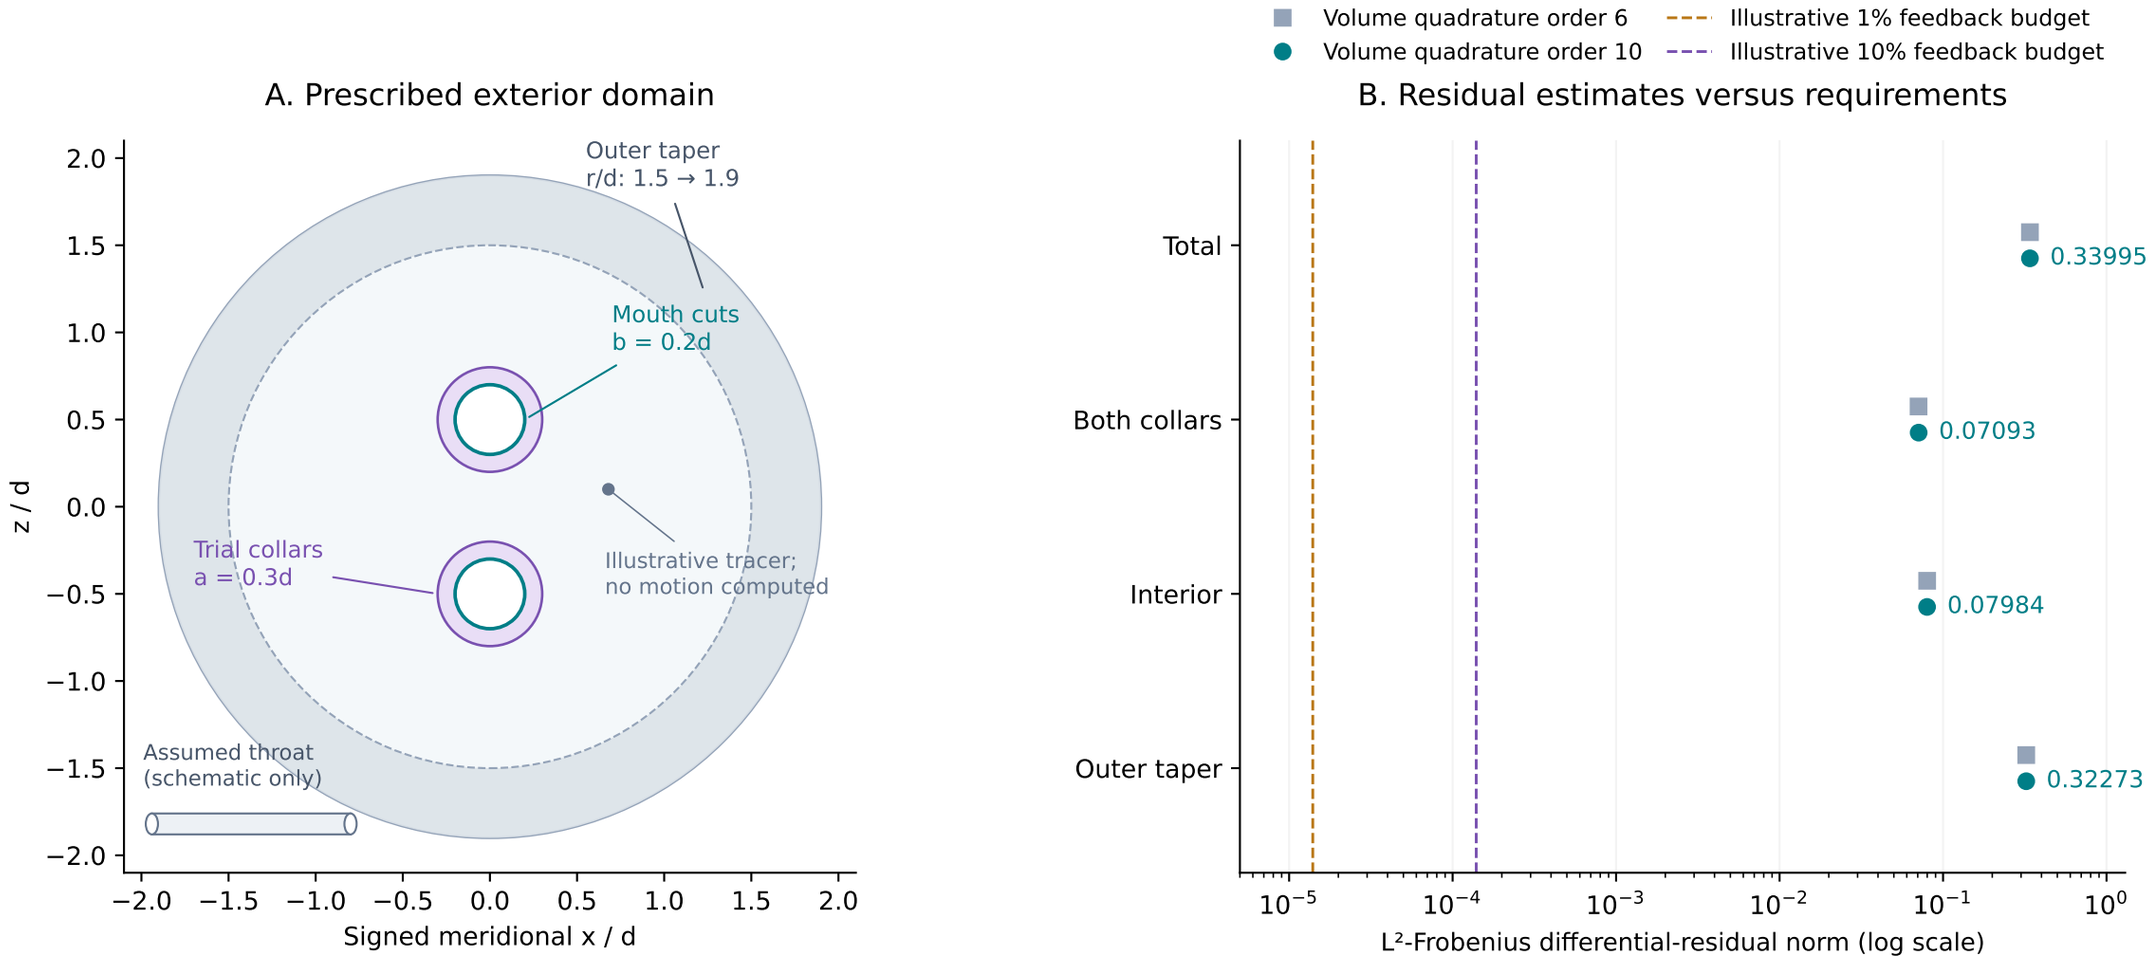
Current continuum trial misses the residual targets

One right-Weyl m=0, five-column trial at x = 0.4439 · Numerical residual estimates, not a physical traveler



Estimated total residual 0.339946: about 24,366× the illustrative 1% requirement.

Collars + interior alone give 0.106798; region norms combine by sums of squares. Targets are conditional, not a total-source error test.

The trial obeys the stated round-boundary construction; sampled volume quadrature does not certify its residual or the missing dual/Weyl/sectors.

Prescribed sharp joins and the full supporting source remain unresolved. No stability or physical transport has been demonstrated.

13 Sep 2027 → 12 Sep 2027 remains unproved; no stable material or machine design is established.
