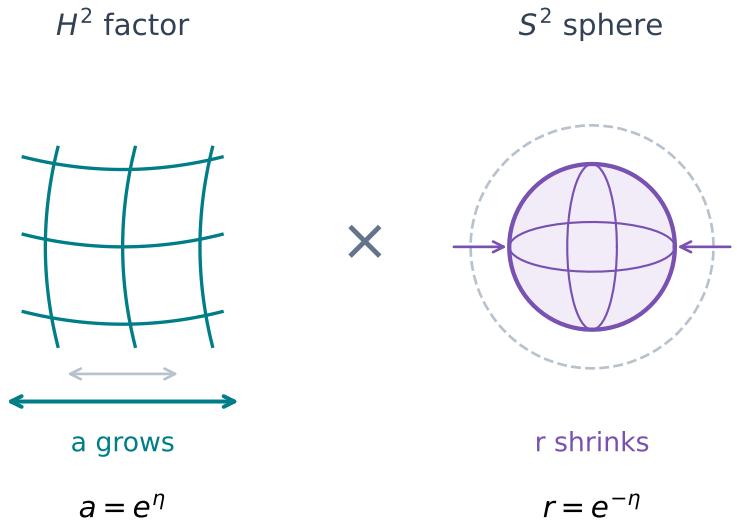
A minimal trace repair still misses part of the shape response

One minimal massless Dirac field | Controlled low-flux tests | Euclidean product geometry

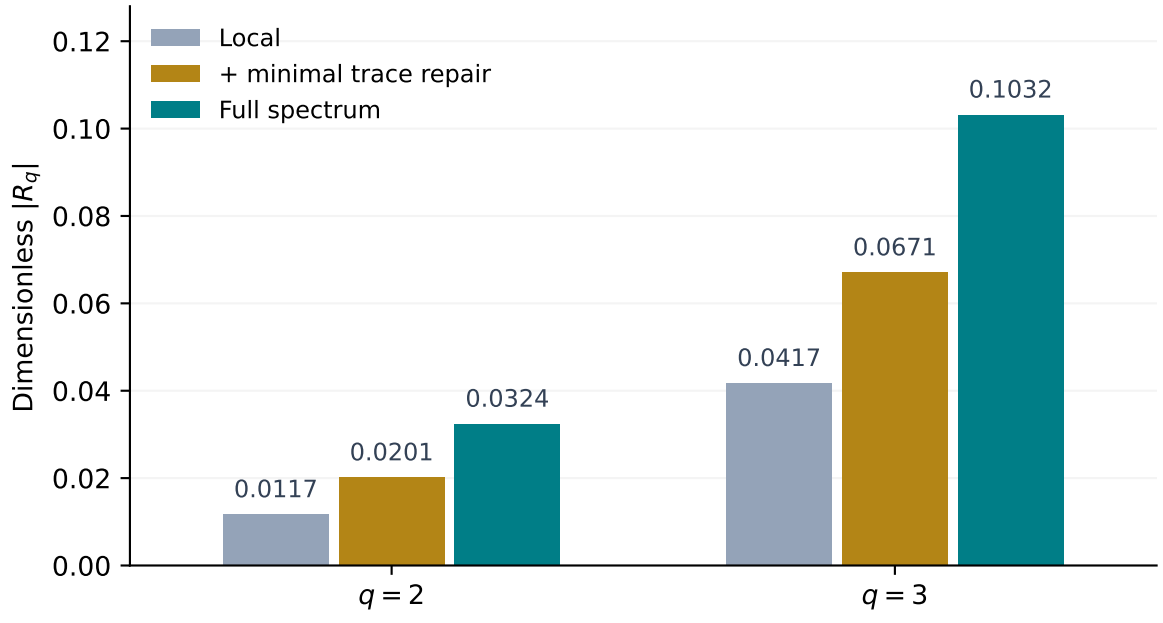
A. Opposite radius changes, fixed volume



Fixed volume element: $a^2 r^2 = 1$; reference $a = r = 1$.

Schematic mathematical deformation, not a formed tunnel.

B. Magnitudes of the finite shape response



Minimal repair misses 38% (q = 2) and 35% (q = 3).

Signed responses are negative; bars show their magnitudes.

$$C_q = w(q) - q^2 w(1) + (q^2 - 1) w(0), \qquad R_q = dC_q/d\eta|_{\eta = 0}$$

w is action density; q = 1 is the fixed reference. This combination is not a single-q pressure or extra throat-opening stress.

Next: a conserved stress tensor and physical throat matching. These low-flux comparisons give no high-flux error bar.

No constructed stable medium or 13 → 12 Sep 2027 passage demonstrated.
