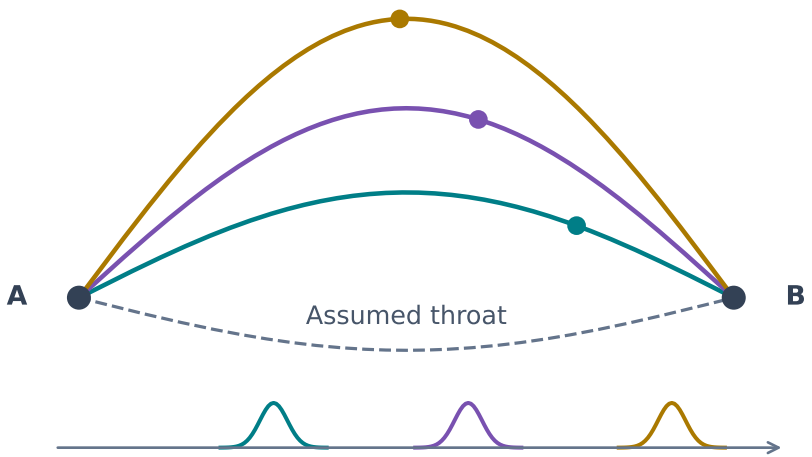
Same equations; finer arrival-time sampling meets the check

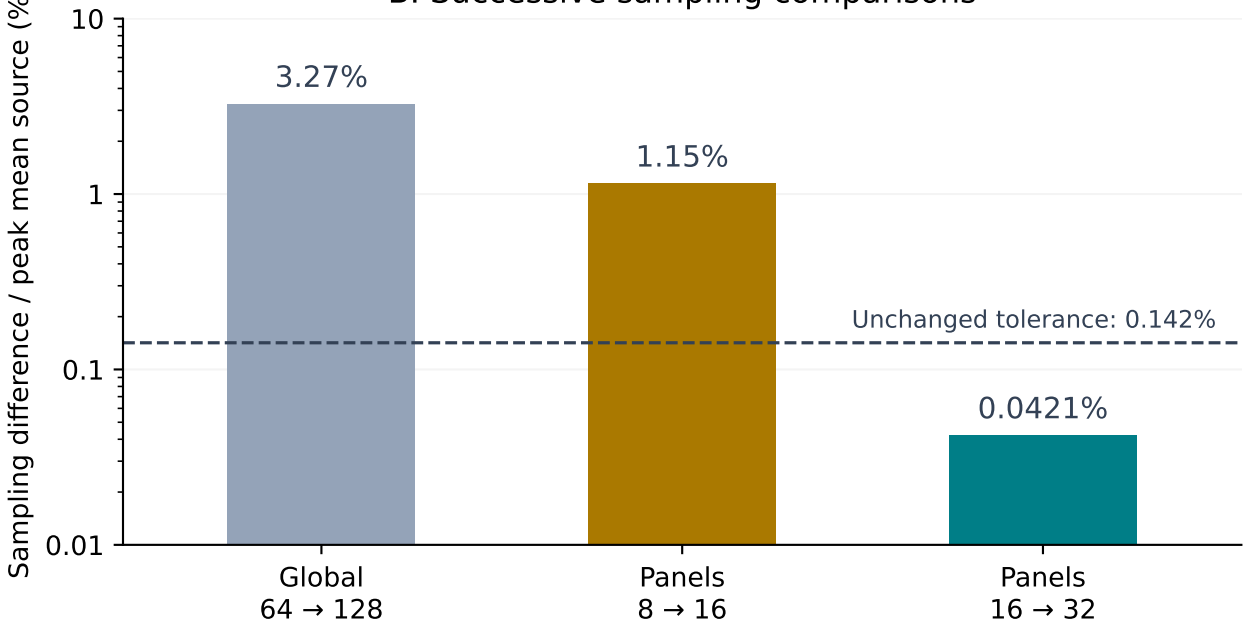
Finite linear pulse-response test | The acceptance threshold was not relaxed

A. Unequal return paths — assumed geometry



Different path lengths spread the pulse arrival times.
Sampling is refined within each arrival-time interval.

B. Successive sampling comparisons



Panel numbers are points per arrival-time interval.
Absolute source tolerance: 2×10^{-7} (model units).

Time-step refinement and the independent one-channel control also pass the saved checks.

Finite sampled convergence is not a stability proof; exterior motion, physical matching and preparation remain unresolved.

No constructed stable medium or 13 → 12 Sep 2027 passage demonstrated.
