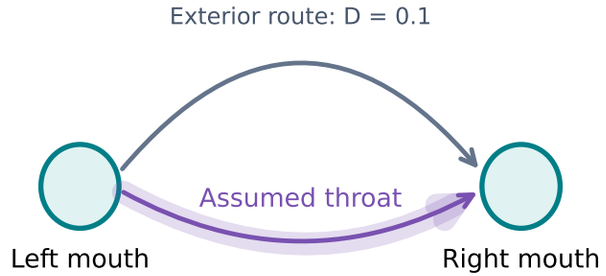
A driven throat needs extra forcing; the proton has a candidate outgoing field

Verified equations and ideal trajectories — neither drawing is a construction blueprint

The proposed passage being tested

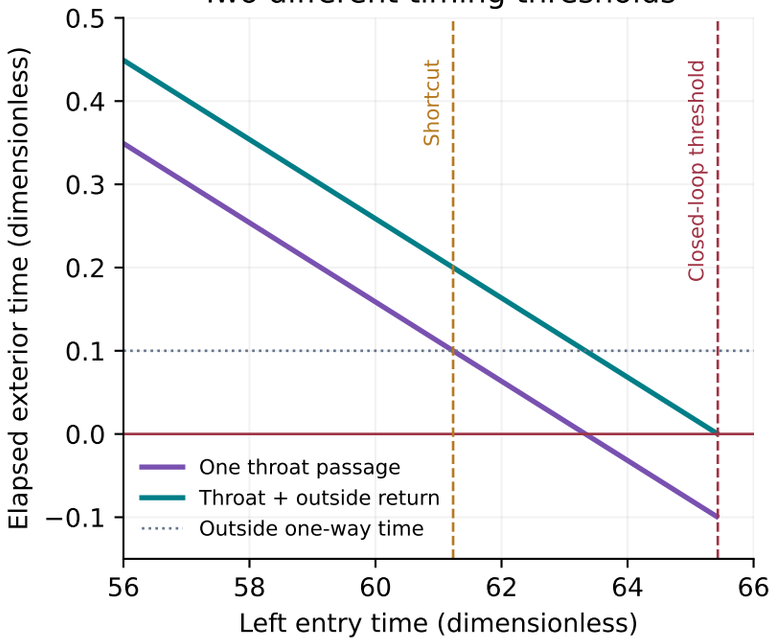


Right clock ramps to 1.05 × left rate

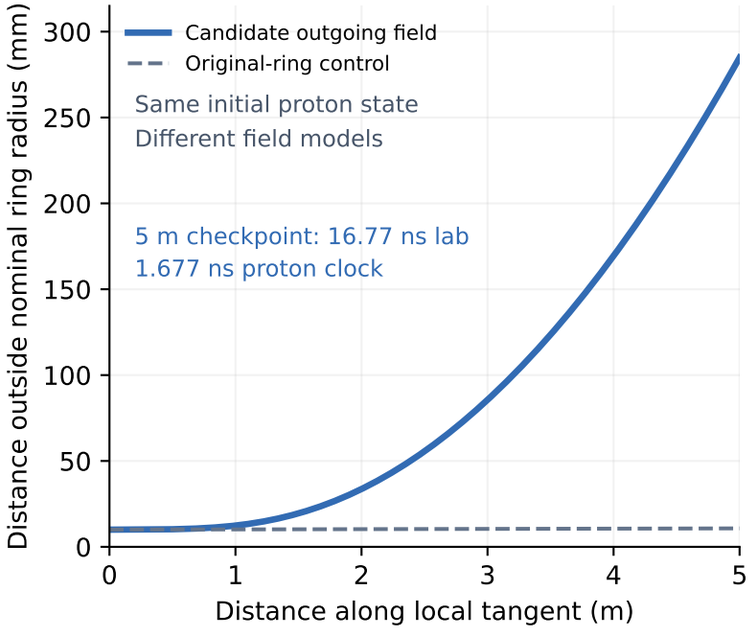
Quantum stress follows repeated returns

Creation and physical driving remain unsolved

Two different timing thresholds



Proton in a smooth outgoing field



Past: the imposed drive fails its gravity balance. At the assumed shortcut, one chiral stress is about 200 × its initial magnitude.

Future: Maxwell equations and the local outgoing trajectory pass. Matching one entry point does not join this field to the earlier storage ring.

Next: specify a physical boundary source and solve its feedback; design one common storage-to-exit magnetic field. Diagram is schematic.

13 → 12 Sep 2027: unproved. **13 → 14 Sep: time dilation is supported; the complete proposed apparatus remains unbuilt.**
