Finite magnetic source surfaces tested; one matching term cancels

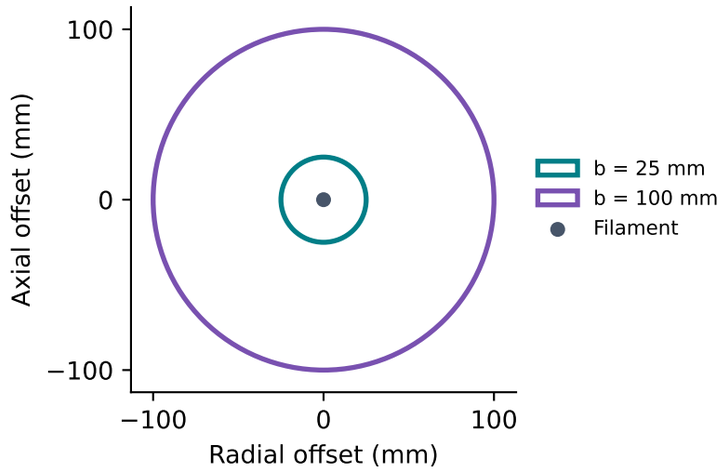

Forward magnetic controls and a separate static gravity diagnostic • no demonstrated time-travel medium

A. Forward magnetic control sources

Two torus surfaces: a = 1.25 m; separation = 2.5 m
Shown b = 100 mm; dashed lines = prior filaments

B. Cross-section of one current tube

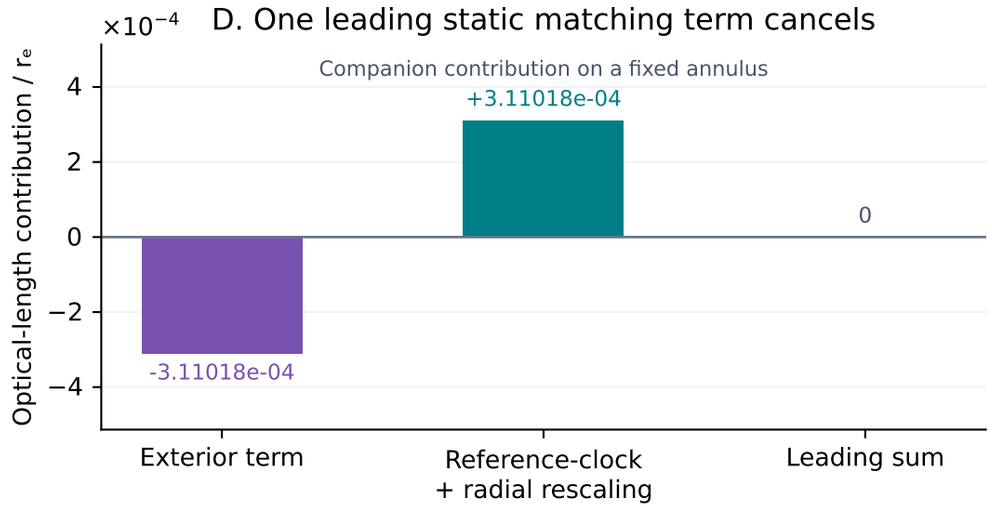

Current is prescribed on each surface
Material response is not modeled

C. Proton reaches 5 km for all three sources

Source	Lab (μs)	Proper (μs)	Shift at 5 km (m)
Filament reference	18.495925	1.849549	0.00
Surface: b = 25 mm	18.494971	1.849454	34.53
Surface: b = 100 mm	18.481172	1.848074	533.93

Same 1.28 μs pulse, -5.25 MA, starting phase and orbit
Shift: position change from the filament at its 5 km crossing
Finite-source differences are physical model changes

D. One leading static matching term cancels

Forward controls: prescribed surface currents now generate the trajectory fields. Feeds, current redistribution and material survival remain open.

Gravity: one leading static clock/coordinate term cancels. Full geometry, quantum source, orbital motion and stability remain unresolved.

13 → 12 Sep 2027: unproved. **Forward time dilation is supported; these rings are magnetic controls, not a spacetime portal.**
