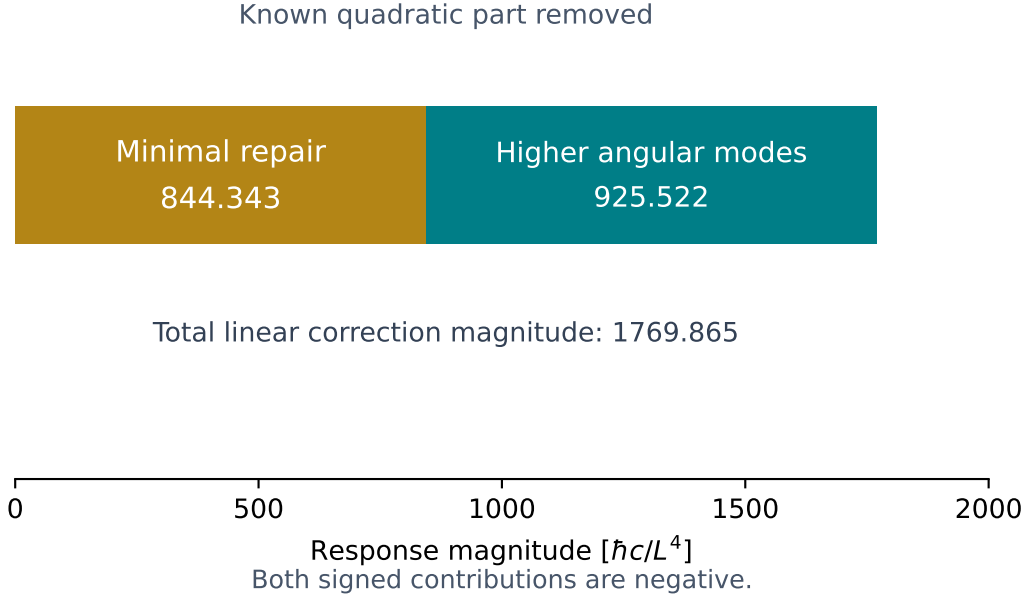
An omitted quantum contribution survives at the model’s magnetic flux

Minimal massless Dirac field | Homogeneous product vacuum | Full angular spectrum retained

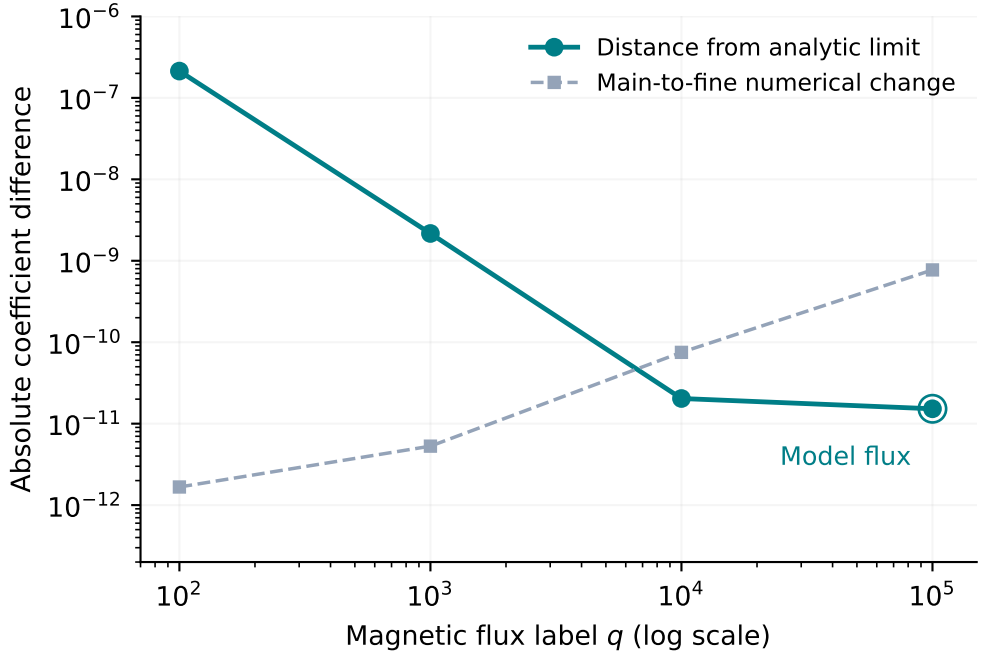
A. Linear correction at q = 100,000



Omitted: 52.3% of this linear correction

Only 2.93 ppm of the leading quadratic response.

B. Numerical approach to the analytic coefficient



Extracted coefficient: $q(R/q^2 - C_0)$

Analytic limit C_1 = -0.017698653098

Observed convergence, not a certified total error bound.

R is the fixed-volume shape derivative of $3W(3q) - 8W(2q) + 5W(q)$; these bars are not a single-flux pressure.

Homogeneous vacuum: $\rho + p_r = 0$. This correction supplies no throat-opening stress or material prescription.

No constructed stable medium or 13 → 12 Sep 2027 passage demonstrated.
