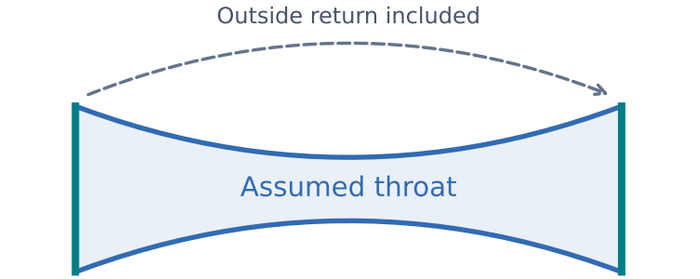
Throat interior tested; a proton leaves its storage orbit

Two ideal model calculations • finite throat samples and conditional proton initial data

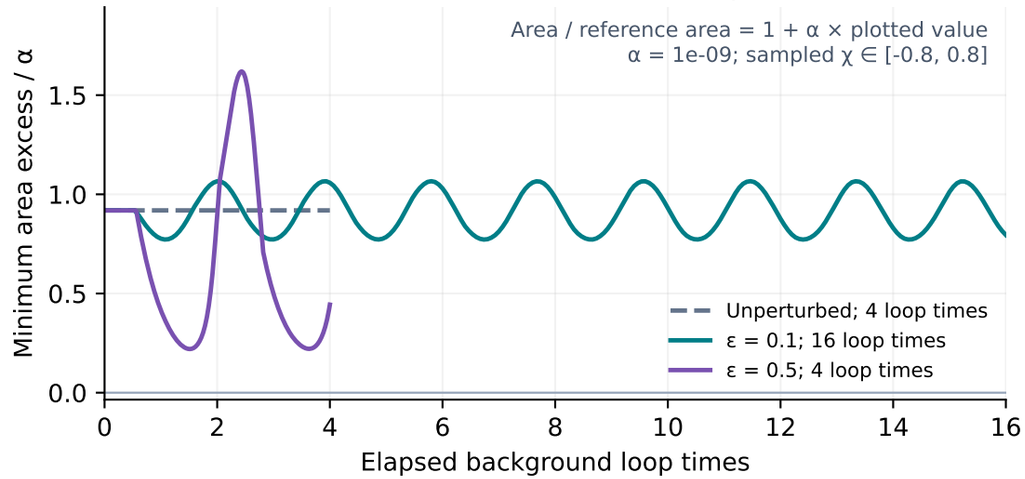
A. Assumed geometry — schematic, not a blueprint



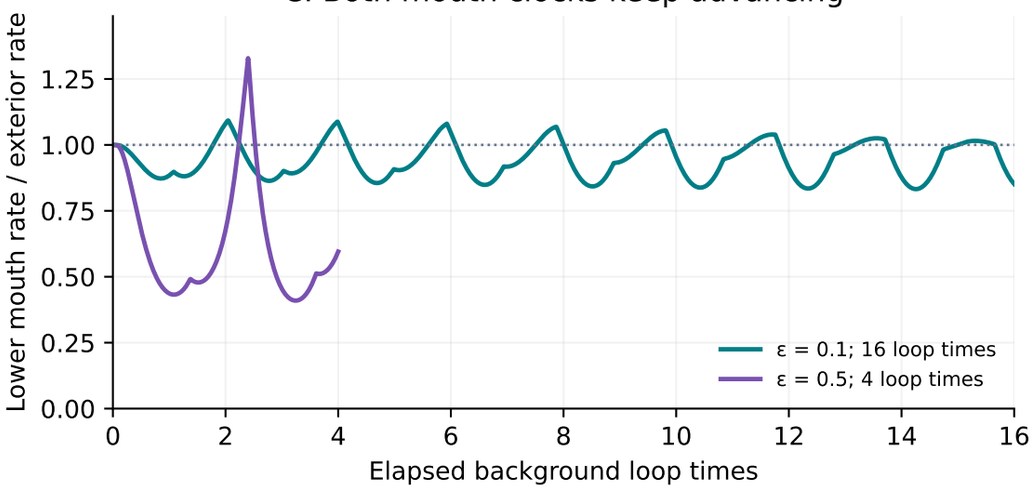
Smallest sampled complete return: 2.573 > 0

Model time units • no past return in these samples

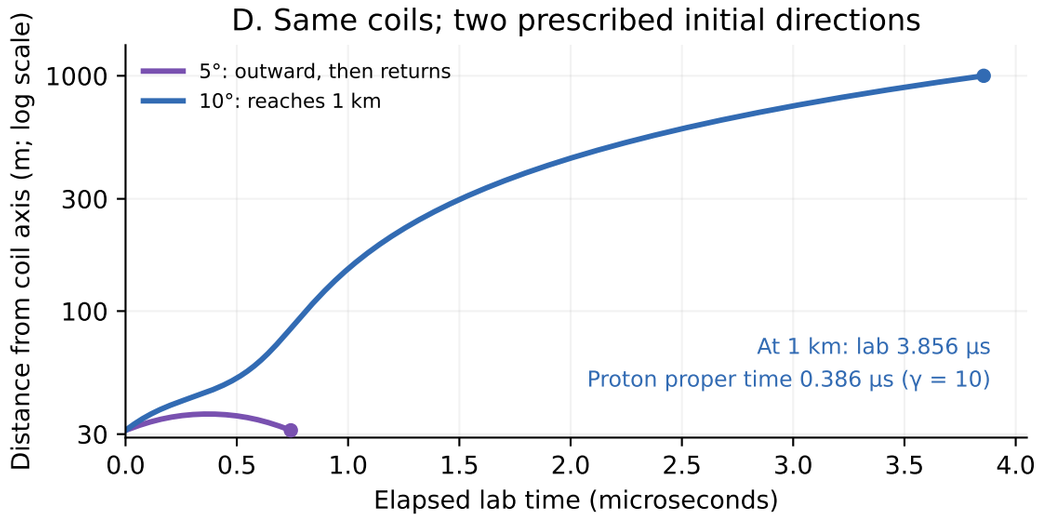
B. Minimum area excess in the sampled interior



C. Both mouth clocks keep advancing



D. Same coils; two prescribed initial directions



Throat: leading reconstruction on a finite strip and time interval. Positive sampled area does not prove stability or safe passage.

Proton: the changed direction is prescribed. A physical kick, capture, readout and one-day storage remain unmodeled.

13 → 12 Sep 2027: unproved. **13 → 14 Sep: time dilation is supported; this complete journey is not demonstrated.**
