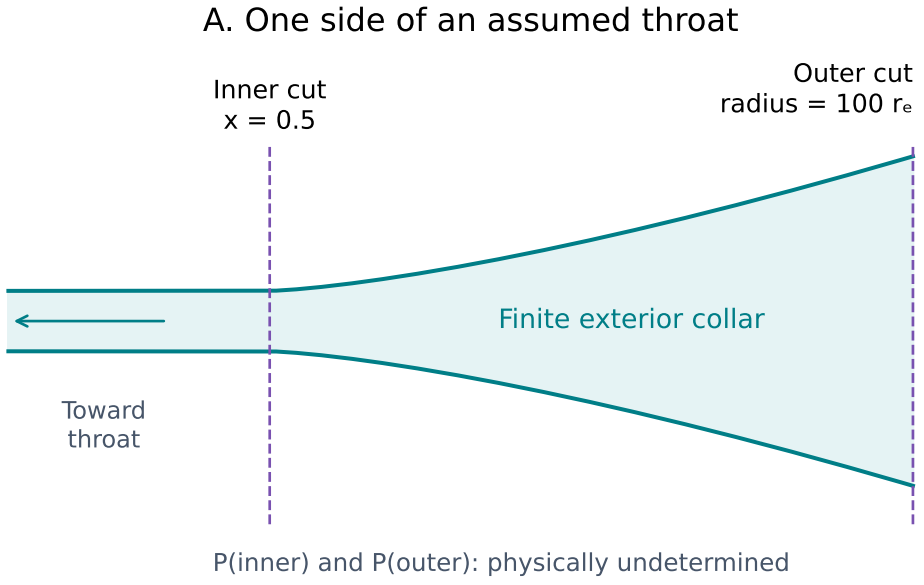
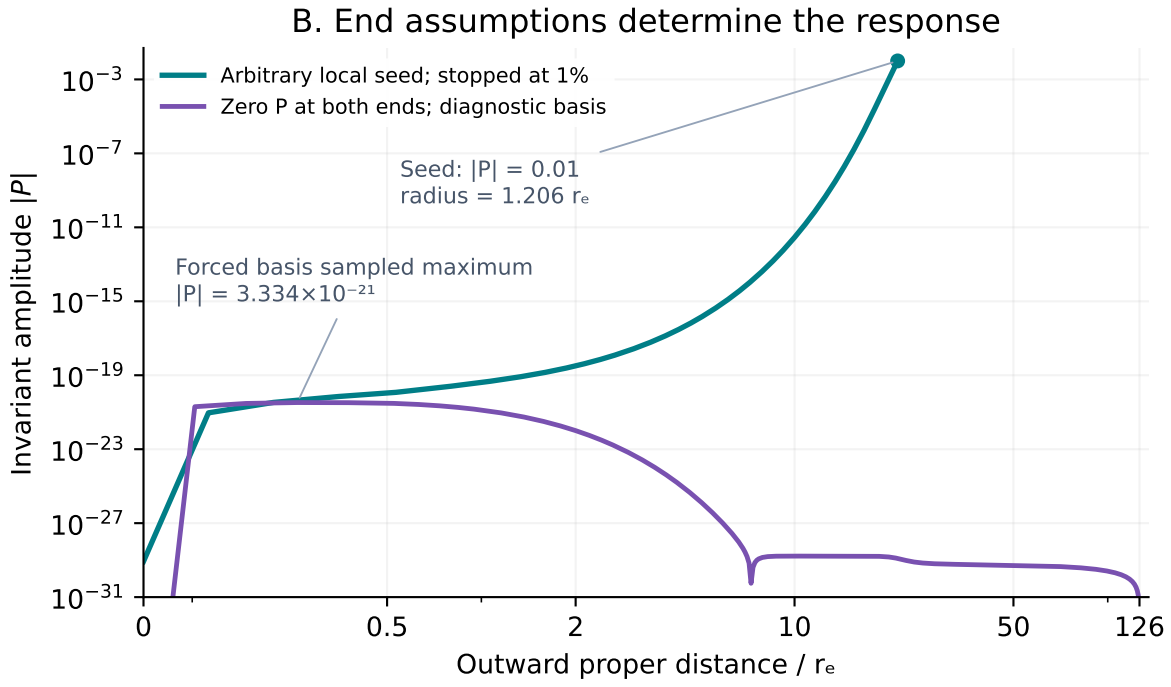
Collar response now uses coordinate-independent variables

Static linear model • Same $\alpha = 10^{-9}$ and prescribed source • Different endpoint assumptions



Schematic, not to scale; the other mouth is not shown.
The response map still needs physical end conditions.



Inner distances expanded (symlog); near-zero values below range.
Different end assumptions: neither curve establishes stability.

The 1% invariant stop differs from the earlier coordinate stop. Global state feedback and physical mouth matching remain unresolved.

No constructed stable medium or 13 → 12 Sep 2027 passage established.
