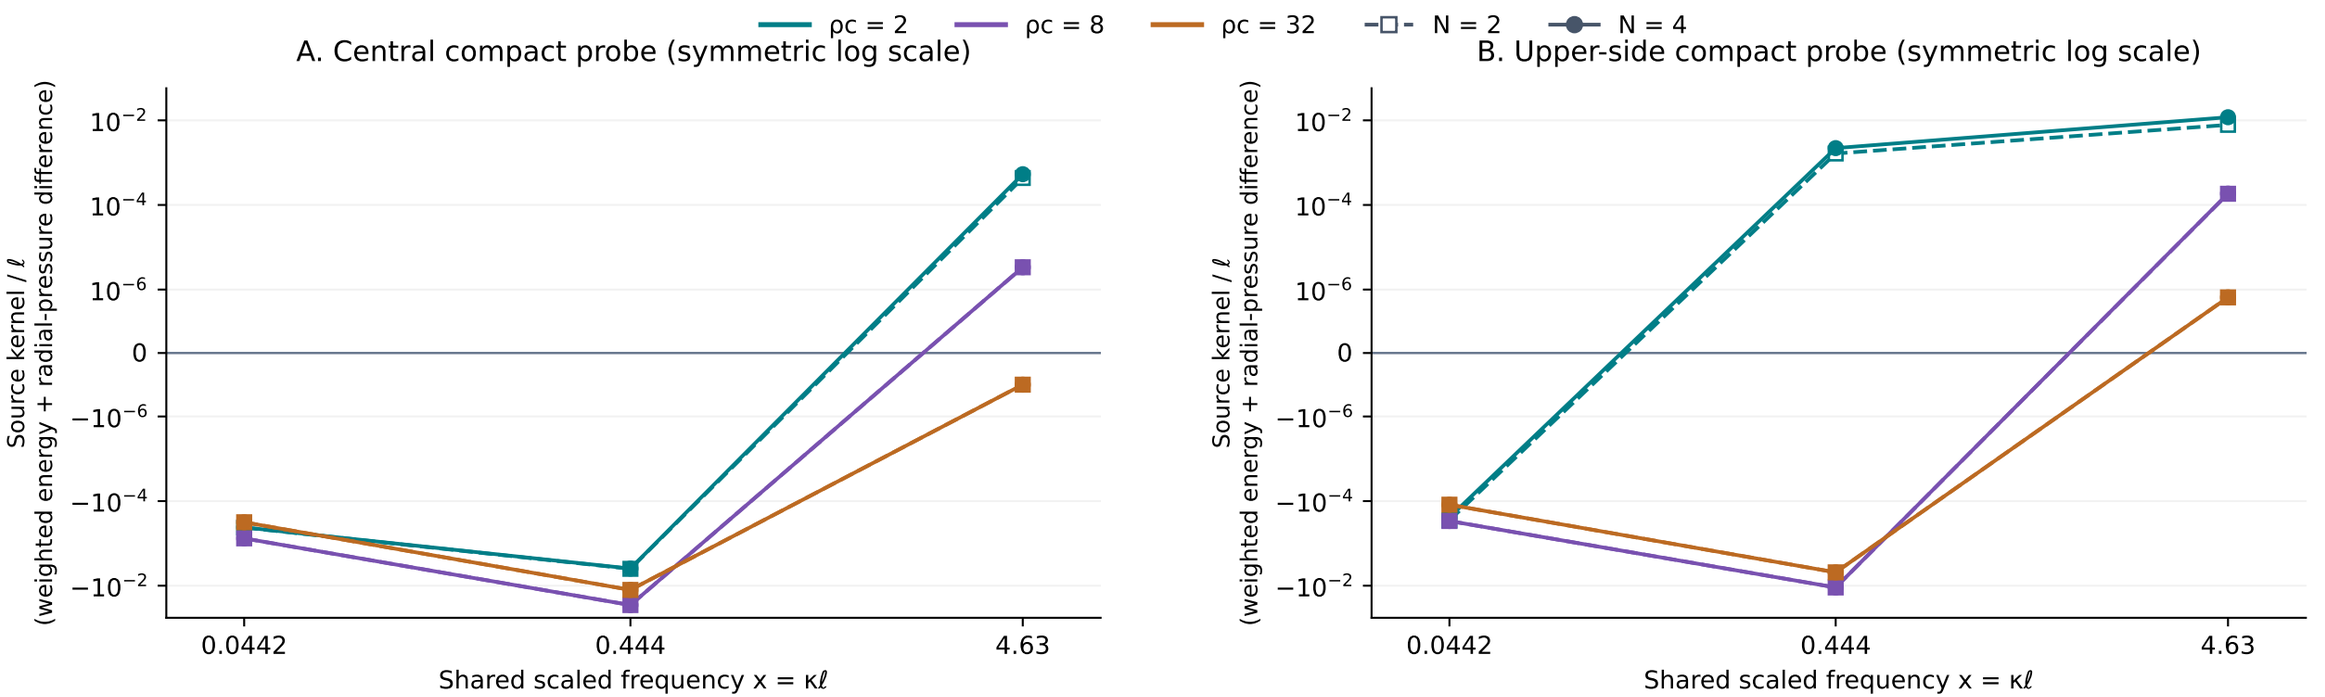
Longer prescribed throats: a sampled source comparison

Phase π · Connected minus invariant AdS reference · b = 0.2d · $\hbar$ = c = d = 1

Prescribed core	Proper length / d	Optical length / d	Center lapse
ρc = 2	0.5775	0.9903	0.44721
ρc = 8	1.1106	4.6646	0.12403
ρc = 32	1.6637	19.7159	0.03123

Length scaled by proper distance; width schematic. Endpoint lapse = 1.



Three sampled integrands only; connecting lines are guides. No frequency integral or supporting-stress verdict.

Both Weyl components; complete finite N = 2 / 4 multiplets; q = 1, outer J = 9, h/d = 0.05. Infinite angular sum remains open.

At ρc=32, middle x only: h/d 0.05 → 0.035 changes N=4 values by -2.23e-05, -8.61e-06; not error bounds.

Probe proper supports change with ρc. Optical length is endpoint-clock light travel time; sharp junction support remains unresolved.

Assumed geometry, not a physical medium. 13 Sep 2027 → 12 Sep 2027 remains unproved.
