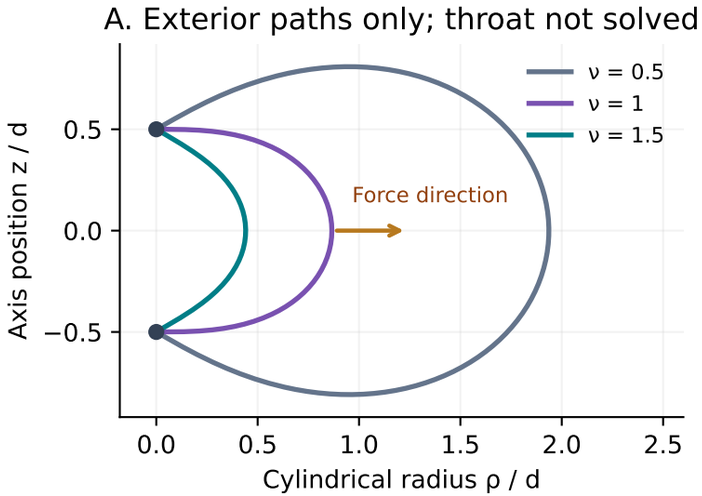
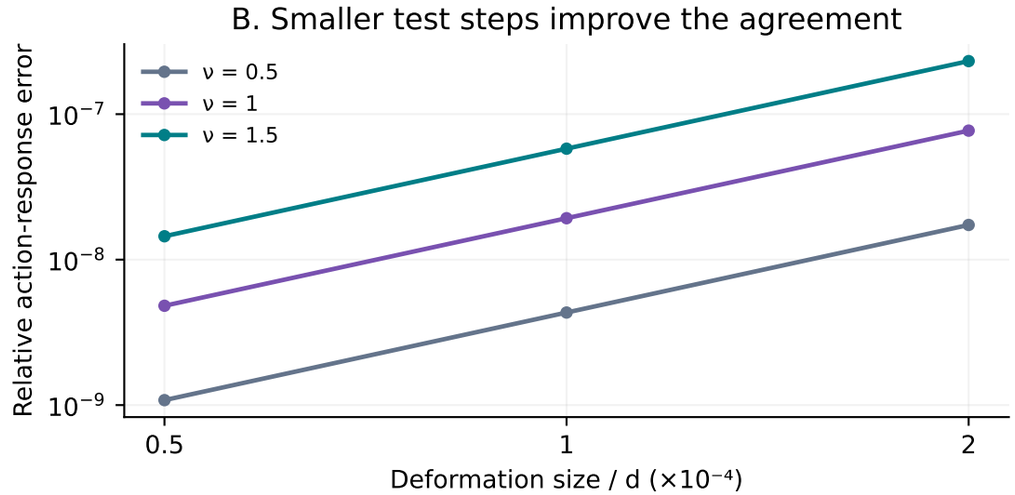
Testing a magnetic source and the receiver’s radiation cost

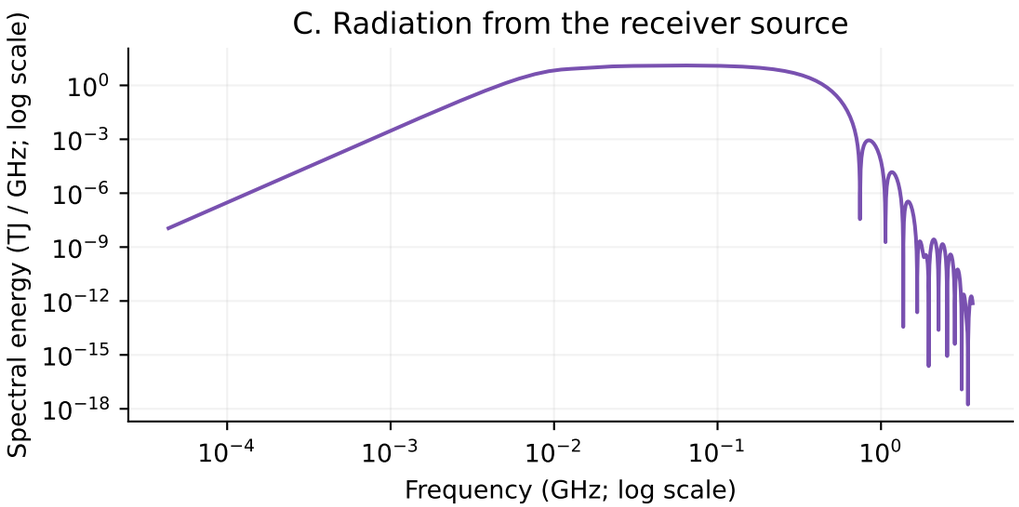
Separate theoretical calculations • exterior magnetic paths and prescribed discharge currents • no built time machine



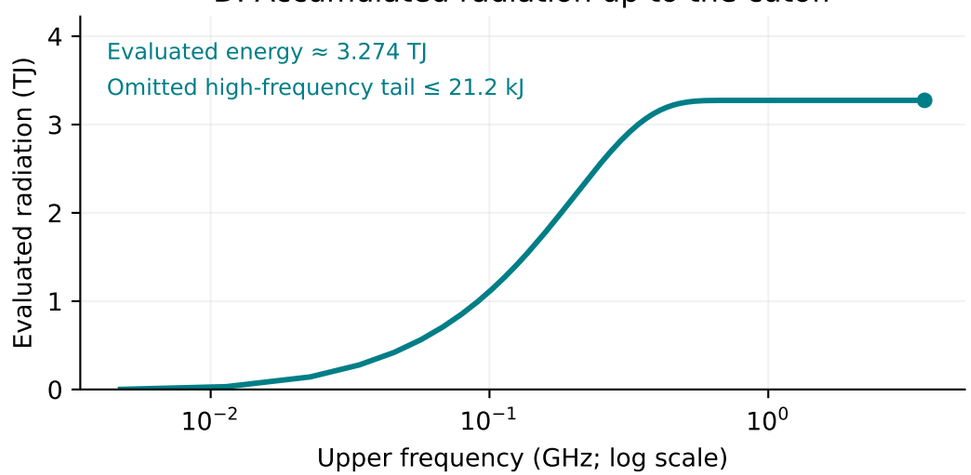
Dots: assumed mouth locations. The arrow shows direction only.
The derived current still needs a new magnetic field solution.



Worst of three test metrics; one is deliberately amplified.
Independent sampled stress differentiation: max error 9.9e-12.



3.5 ns charge fall; full discharge, all directions at infinity.



The tail bound is separate from numerical integration error.

Source: selected flux channels on prescribed geometry. Full field and gravity responses, a global quantum state and a stable throat remain unresolved.

Radiation: the isolated receiver discharge. Initial full field energy, driver work and a material or circuit response remain unresolved.

13 → 12 Sep 2027: unproved. **Forward time dilation is supported; a complete journey and receiver capture remain unproved.**
