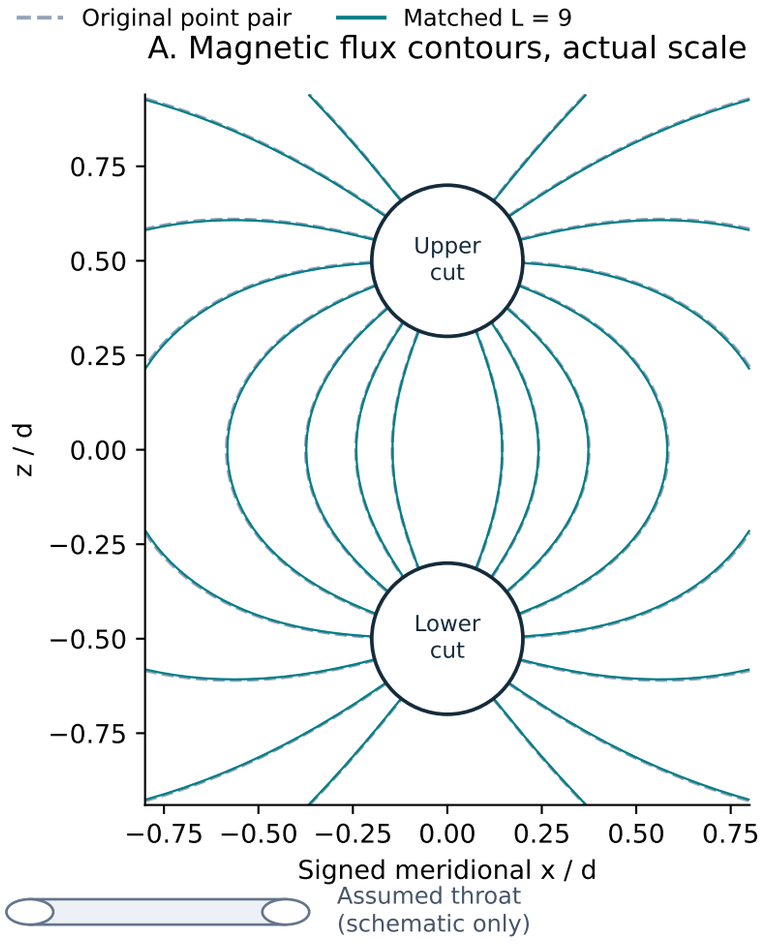
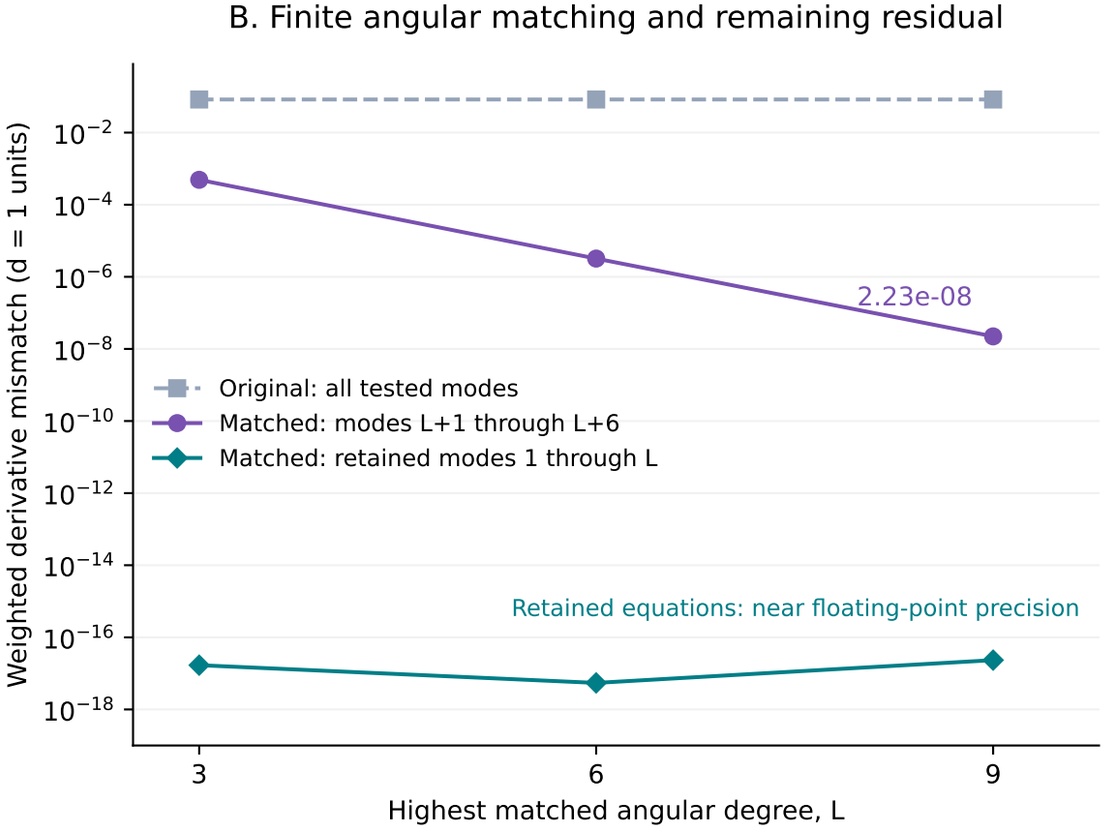
Magnetic matching improves; the supporting geometry remains unresolved

Prescribed product core + flat two-mouth exterior · q = 1, mouth radius b = 0.2d · Source-free Maxwell test





Contours nearly coincide at true scale. They are fields, not particle paths.

Only finite angular matching is solved; the untested tail is not bounded. Quadrature and cutoff checks are numerical consistency tests.

The sharp metric join and its stress remain. The quantum source must be reconsidered in the corrected magnetic field.

No material, formation or stability result follows from this field-matching calculation.

13 Sep 2027 → 12 Sep 2027 remains unproved; this is not a physical medium or construction blueprint.
