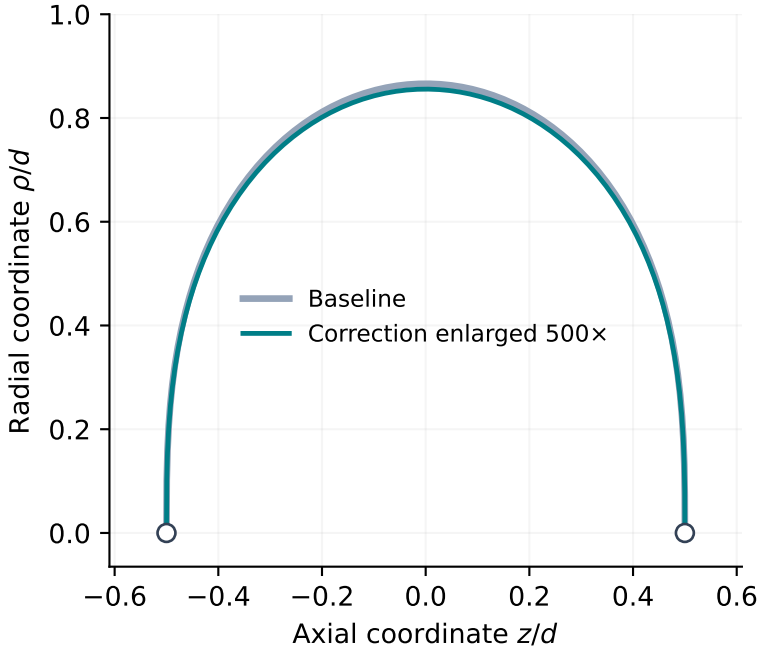
Local magnetic polarization slightly shortens the modeled exterior paths

Computed first-order correction | Flat local-action approximation | Fixed point-source endpoints

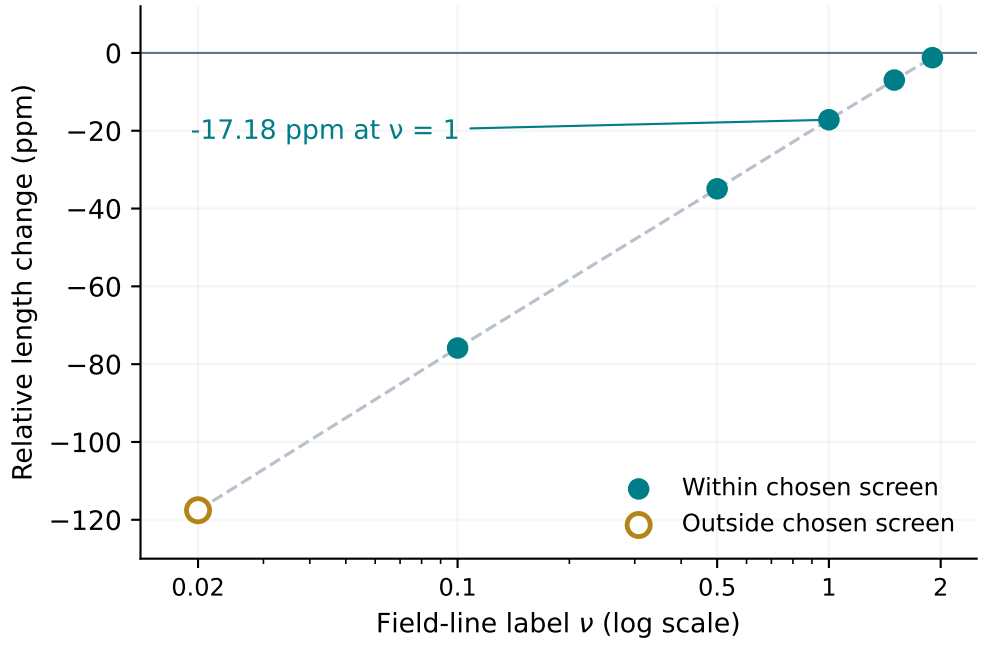
A. Exterior field line $\nu = 1$



Displacement magnified 500× for visibility.

Assumed mouth points; no finite entrances or throat shown.

B. Actual predicted length changes



No enlargement in this panel; negative means shorter.

The flagged $\nu = 0.02$ result remains a formal prediction.

Chosen screen: full gradient parameter < 0.1 at turning points. This is not a uniform physical error bound.

The nonlocal current, curved exterior geometry, finite-mouth matching and stability remain unresolved.

No constructed stable medium or 13 Sep 2027 → 12 Sep 2027 passage demonstrated.
