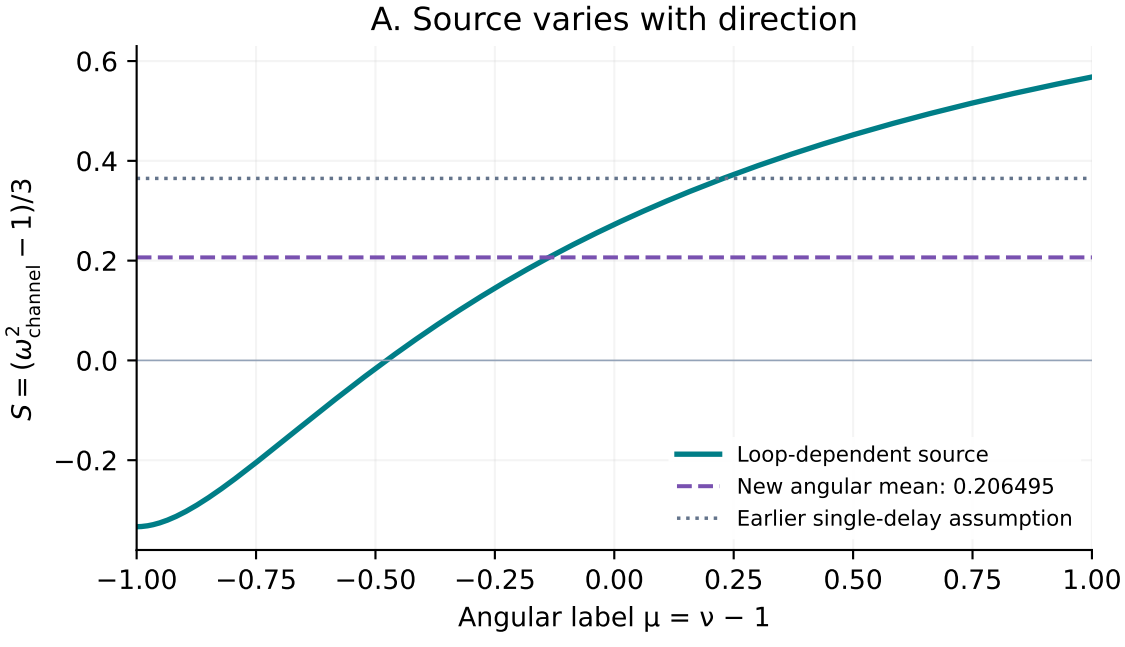
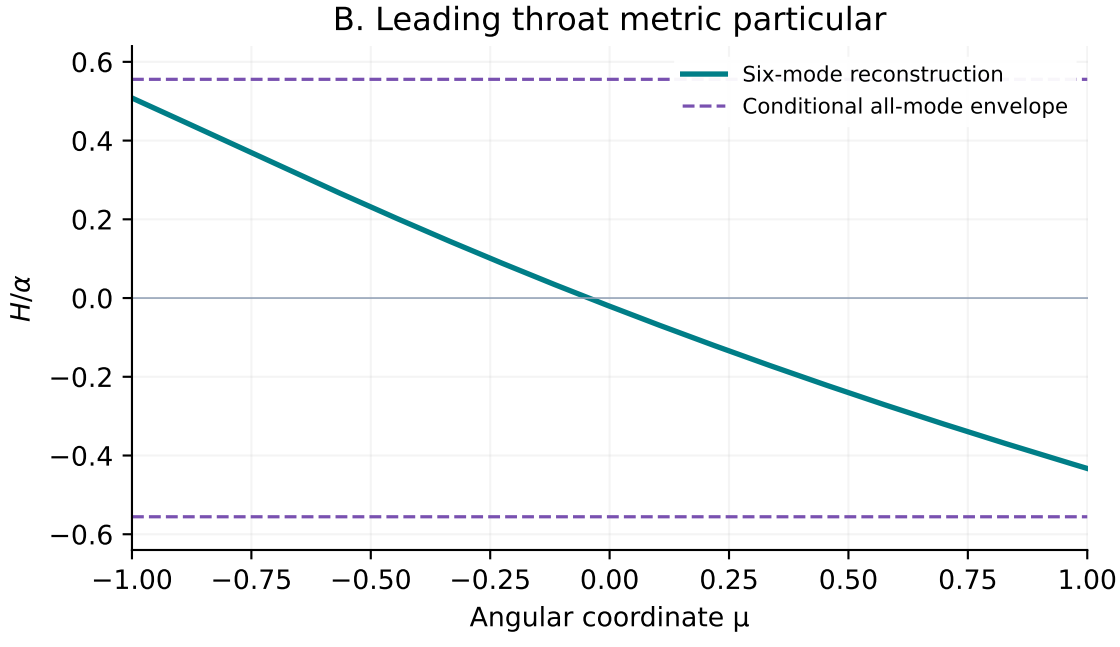
Angular quantum source and leading metric response

Assumed throat geometry and prescribed magnetic paths • Cutoff radius 100 r_e • 128-point angular quadrature



Mean 0.206495; angular RMS deviation 0.277798.
Only the angularly averaged state is closed here.



Fixed gauge: $H = h_{tt} = h_{xx}$; this is not a throat shape.
All-mode $|H| \leq 5.556 \times 10^{-10}$; source dipole + quadrupole: 99.897%.

RMS/mean = 1.345 does not prove instability: the absolute stress remains proportional to $\alpha = 10^{-9}$.

Leading throat particular only; mouths and stability unresolved. Bounds use numerical moments, not certified continuum enclosures.

No constructed medium or 13 → 12 Sep 2027 passage established.
