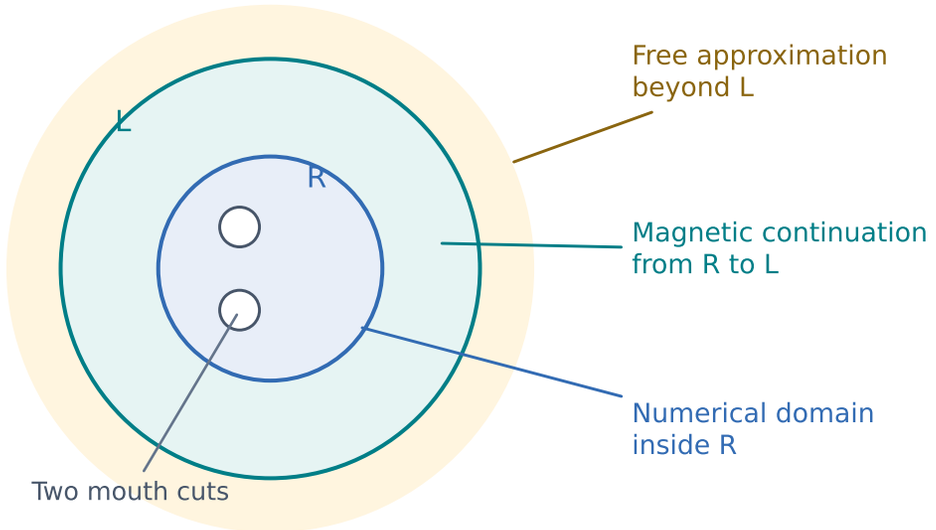
Improved exterior treatment reduces matching-radius sensitivity

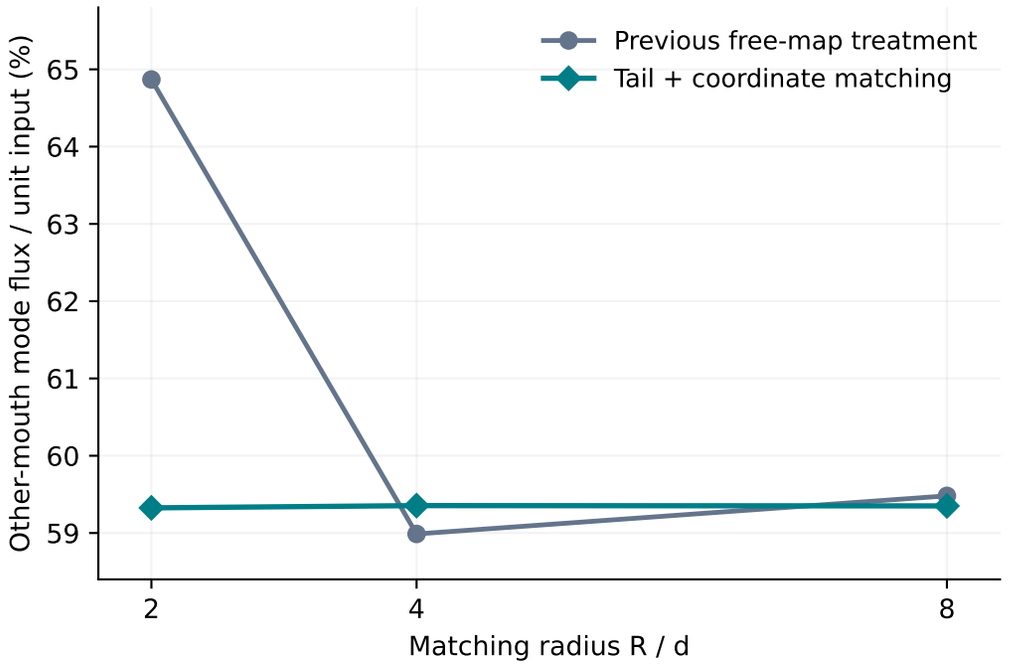
Conditional q = 1 wave model | Prescribed product mouth leads remain unchanged

A. Where each exterior approximation is used



Schematic, not to scale. The continuation ends at L = 160 d.

B. Conditional flux vs matching radius



Fixed mesh h = 0.05 d; angular mode cutoff = 12.

Complex-amplitude change when R is enlarged (previous treatment → tail + coordinate matching):

R/d: 2 → 4 0.0377 → 0.000192 | 4 → 8 0.0128 → 3.88e-05

Finite differences measure sensitivity, not error bounds. Infinity convergence and physical mouth matching remain unresolved.

This conditional field calculation establishes no physical medium or 13 Sep 2027 → 12 Sep 2027 passage.
