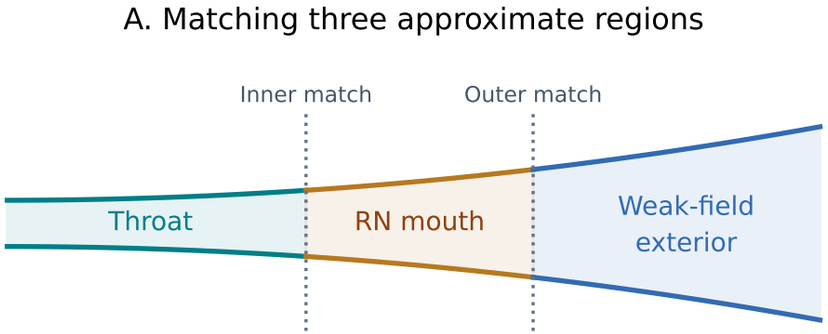
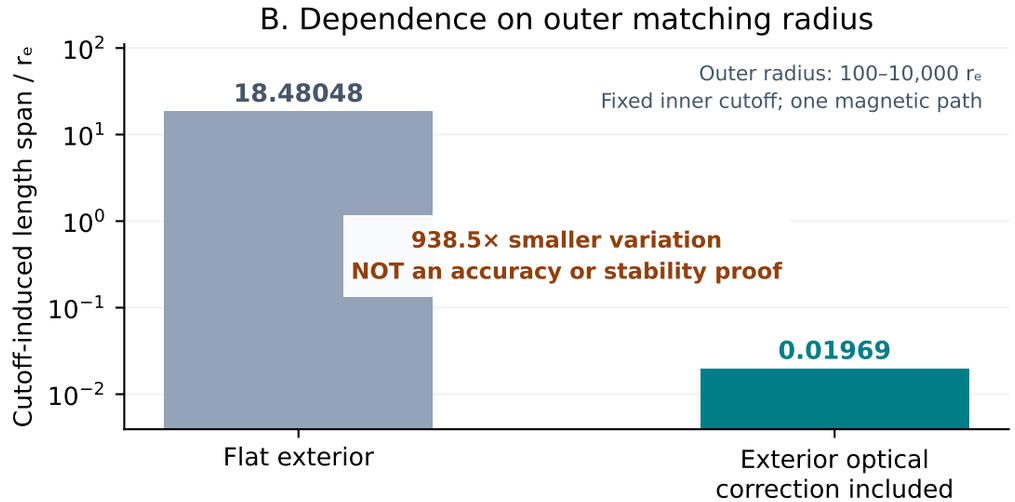
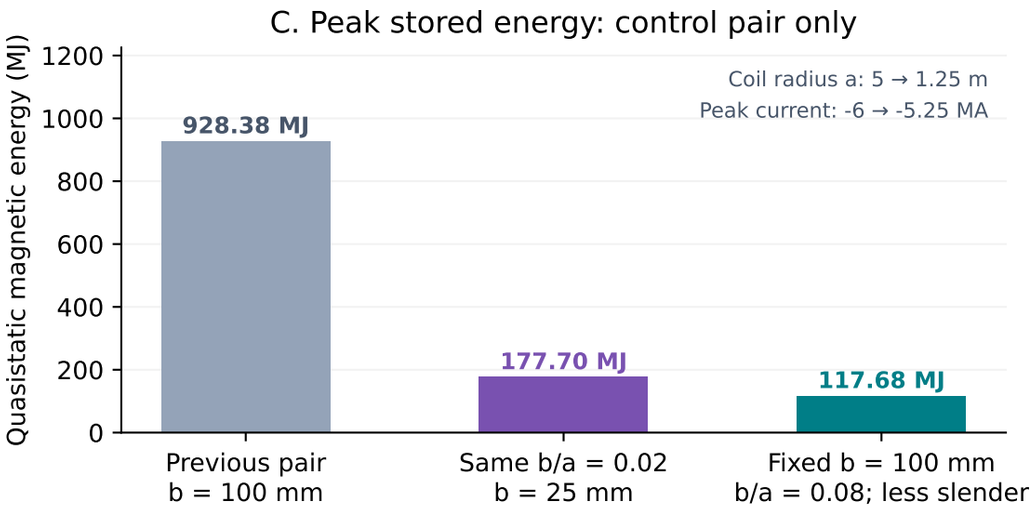
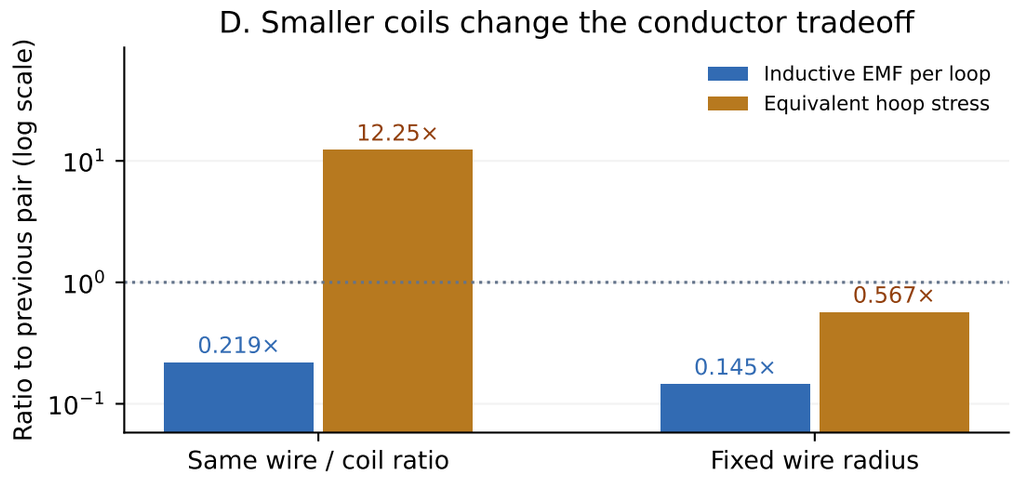
Optical matching and smaller control coils: what changed

Two independent model checks • approximate geometry and conductor estimates • no built medium









Geometry: reduced cutoff sensitivity does not update the quantum source or establish a joined spacetime, stable medium or time offset.

Conductors: stored energy is not dissipation; EMF is not feed voltage. Pair-only hoop estimates assume a solid wire; survival is unproved.

Both wire choices remain cost estimates; their actual electromagnetic fields have not been used to recheck the proton trajectory.

13 → 12 Sep 2027: unproved. **Forward time dilation is supported; a working device remains unbuilt.**
