A field state is possible here. Its stress does not fit.

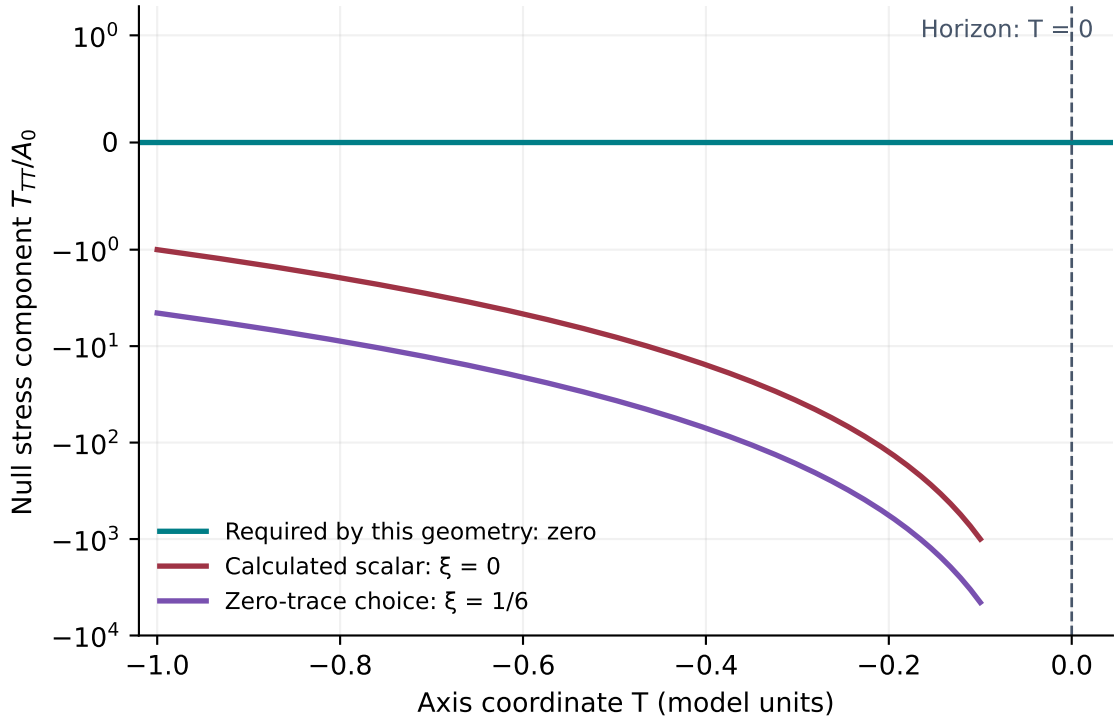

Fixed ideal geometry • one periodic massless scalar • before the first time loops

Visual map of the assumed geometry
The field has not been shown to support it

Central circle at the horizon

One necessary support condition fails

Left: a bounded patch drawn with the periodic coordinate wrapped into a circle; not a material tube or an entrance.

Result: no curvature-coupling value makes this particular state supply the full required stress tensor.

The graph is a fixed-background calculation, not a collapse simulation or a prediction of what a person would feel.

13 September 2027 → 12 September 2027: still no demonstrated route.
