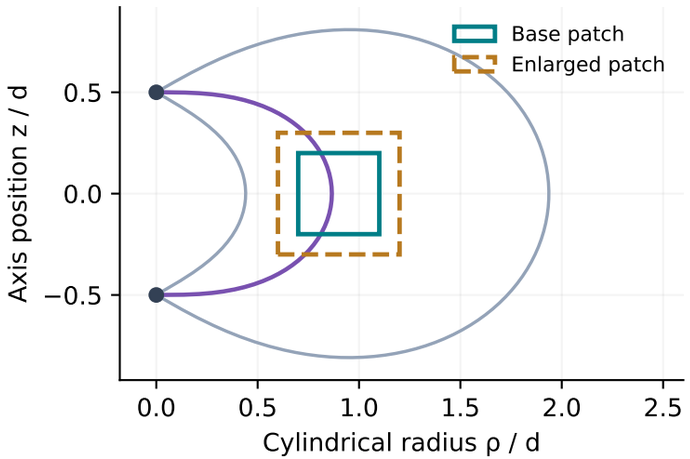
A conditional field correction and a separate RF slowdown

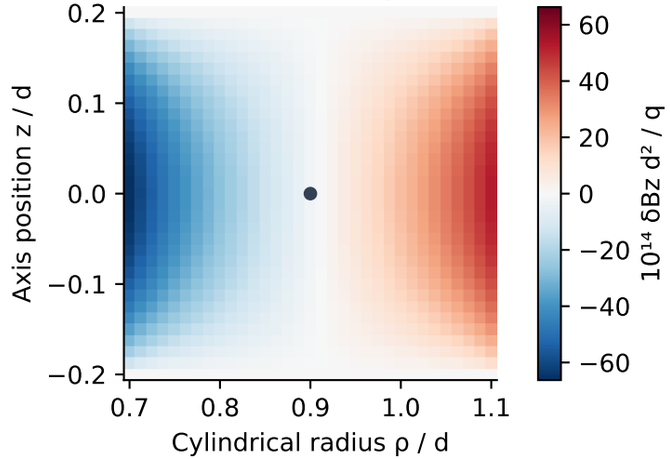
Two idealized calculations • a fixed exterior source and an assumed synchronized orbit • no constructed medium

A. Where the exterior calculation is made



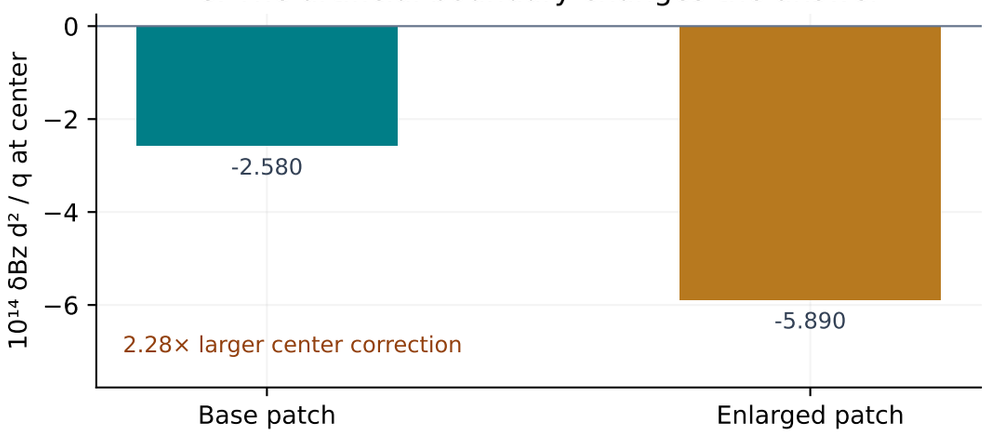
Curves: ideal exterior paths. Dots: assumed mouth locations.
Rectangles are artificial calculation boundaries, not objects.

B. Axial correction, magnified ×10¹⁴



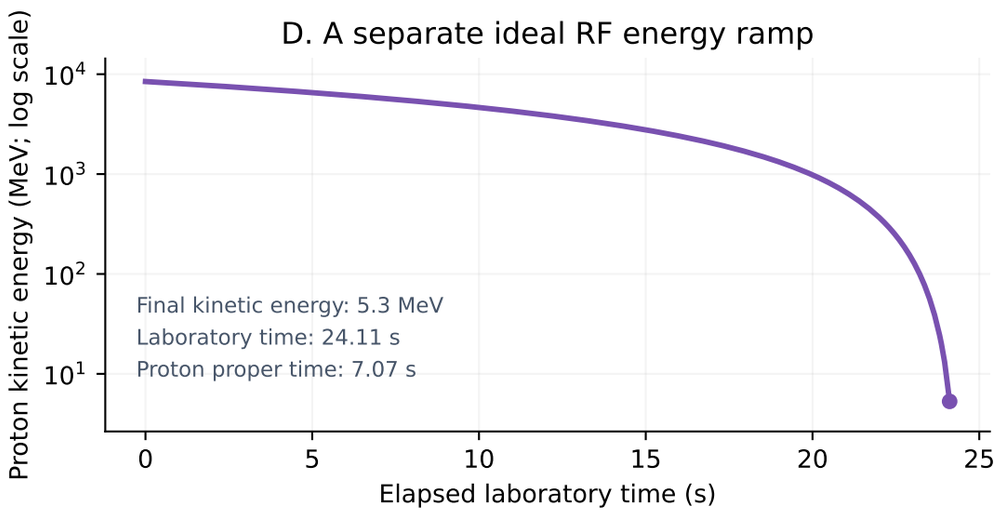
This shows the field correction, not the total field.
Zero flux correction was imposed at every patch edge.

C. The artificial boundary changes the answer



Same grid spacing; different artificial boundaries. This is not a stability test.

D. A separate ideal RF energy ramp



Synchronization is assumed; capture and beam stability are not demonstrated.

Magnetic response: current and geometry held fixed. Physical boundaries, a consistent global source, gravity response and a stable throat remain unsolved.

RF ramp: a separate prescribed orbit, not the earlier receiver trajectory. Complete transport, source hardware and permanent capture remain unproved.

13 → 12 Sep 2027: unproved. **Forward time dilation is supported; no complete human journey has been demonstrated.**
