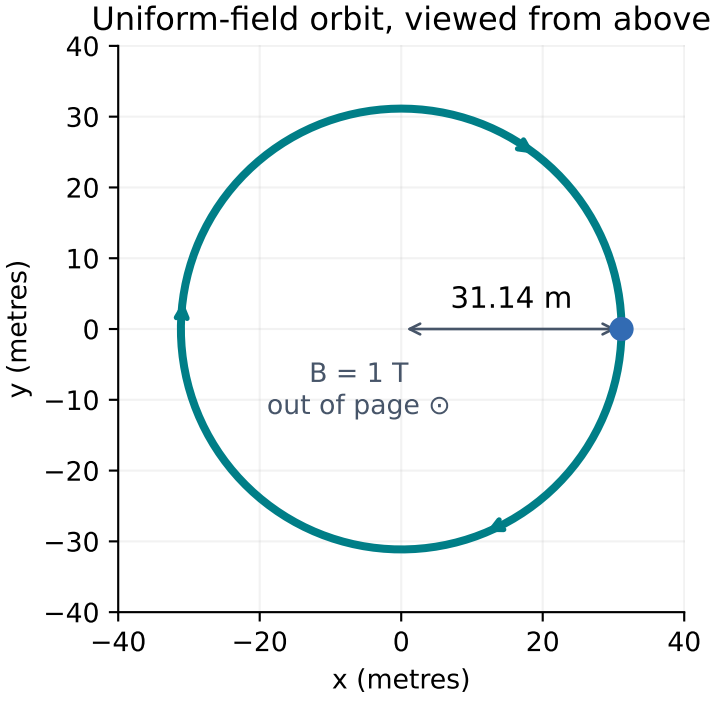
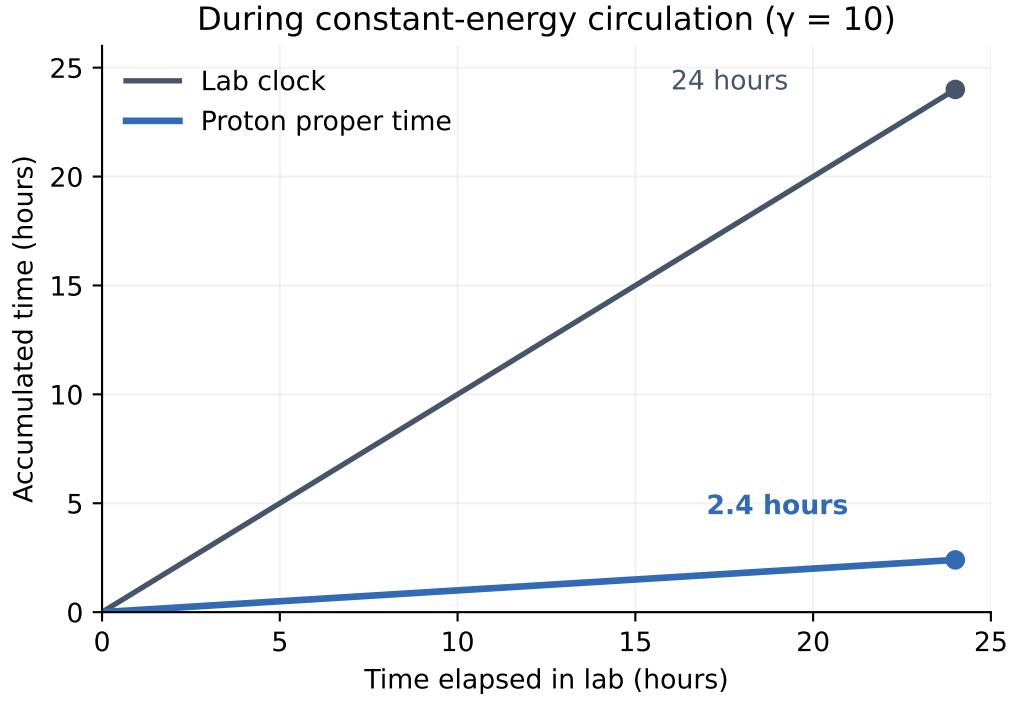
A proton can take the forward route in a ring

Calculated ideal orbit using magnetic force • not a complete accelerator design





Speed: 99.4987% of light speed. Proton kinetic energy: 8.44 GeV; this excludes apparatus energy.

Free-space radiation estimate: 0.251 MeV per proton per day. Ideal energy replacement holds the time ratio fixed.

Uniform B bends the orbit but does not focus vertical errors. No one-day confinement or complete injection/extraction path is demonstrated.

13 → 14 September 2027: forward time dilation. **13 → 12 September: still no demonstrated route.**
