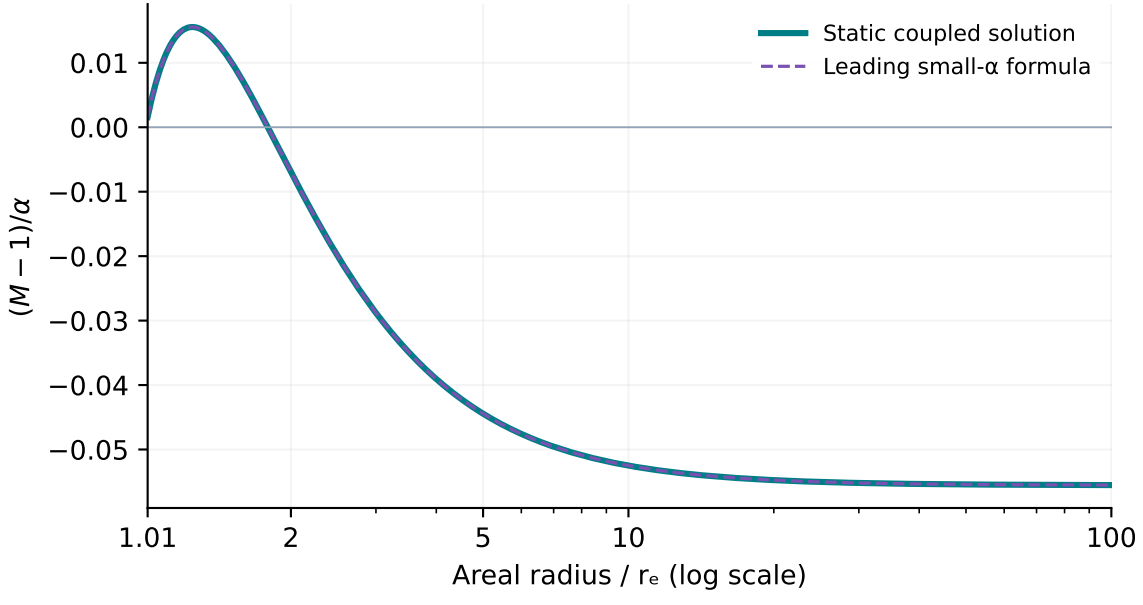
A static exterior with the quantum source retained

Existing throat assumed • Same reduced action • Angular equation retained • $\alpha = 10^{-9}$

A. Mass correction along the exterior



$m_1(R) = -5/(18R^3) + 1/(3R^2) - 1/18$

Curves overlap at this scale; fixed finite R expansion.

B. Finite continuation; return path still open

Region map only — schematic, not to scale

Assumed static throat → Same-source finite exterior ⇢ Returning path not solved

Solved from x = 0.5 to radius = 100 r_e

Remaining optical budget at the outer boundary

1.19999991165

Center-normalized model units

Positive budget; the actual return path is unsolved.
Positivity alone does not close the quantum state.

$M = Gm/(c^2 r_e)$. This is a static finite-region solution, not evolution of the incoming pulse or a dynamic stability test.

The full returning magnetic path, four-dimensional quantum source, physical preparation and global matching remain unresolved.

No constructed medium or 13 → 12 Sep 2027 passage established.
