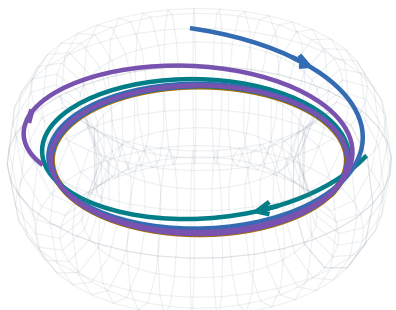
# A quantum obstacle at the first time loops

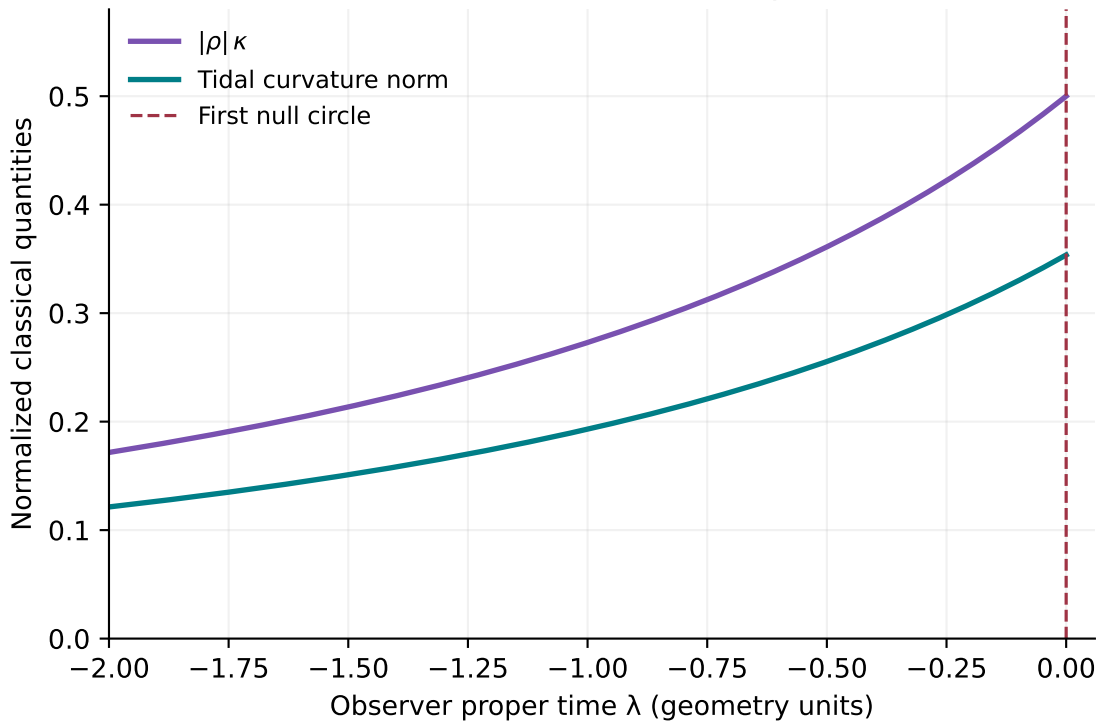
Complete ideal geometry • selected negative-source branch • untwisted example

Trace boundary light paths into the past:
they approach the same closed circle



Central null circle

Classical measurements stay finite



Left: mathematical embedding of a bounded horizon patch; arrows point into the past. No physical tunnel is shown.

KRW theorem: initially regular free-scalar quantum correlations cannot remain Hadamard at the central circle.

Finite classical curves do not establish a regular quantum crossing. The theorem does not give an injury prediction.

**13 September 2027 → 12 September 2027: no demonstrated route.**
