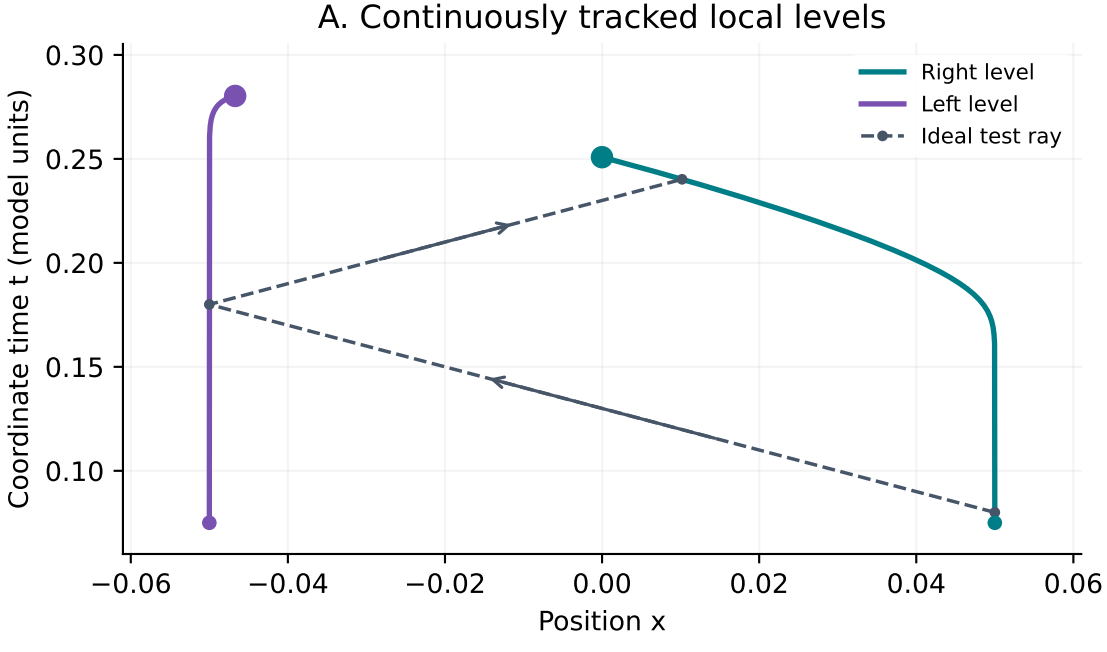
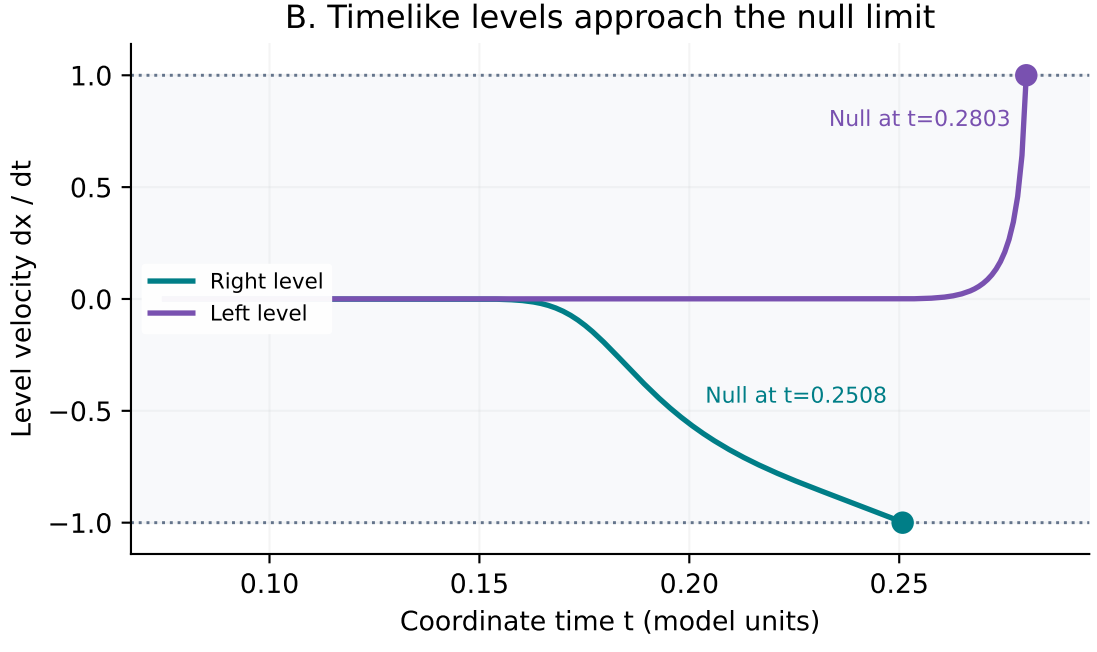
Tracking constant-area levels through a quantum pulse

Local nonlinear model • A pre-existing throat is assumed • These levels are not material mouths



Initialized at x = ±0.05, t = 0.075.
Completed local return: proper duration 0.143624 $r_e/c > 0$.



Dotted limits: dx/dt = ±1. Timelike levels lie between.
This tracks area levels, not trajectories of material objects.

The plotted branches stop at their first null limit; this does not establish an event horizon or a physical entrance.

Local prescribed source and ideal reflection only. Exterior matching, preparation and global stability remain unresolved.

No constructed medium or 13 → 12 Sep 2027 passage established.
