Conditional averaged-source opening; the throat route remains slower

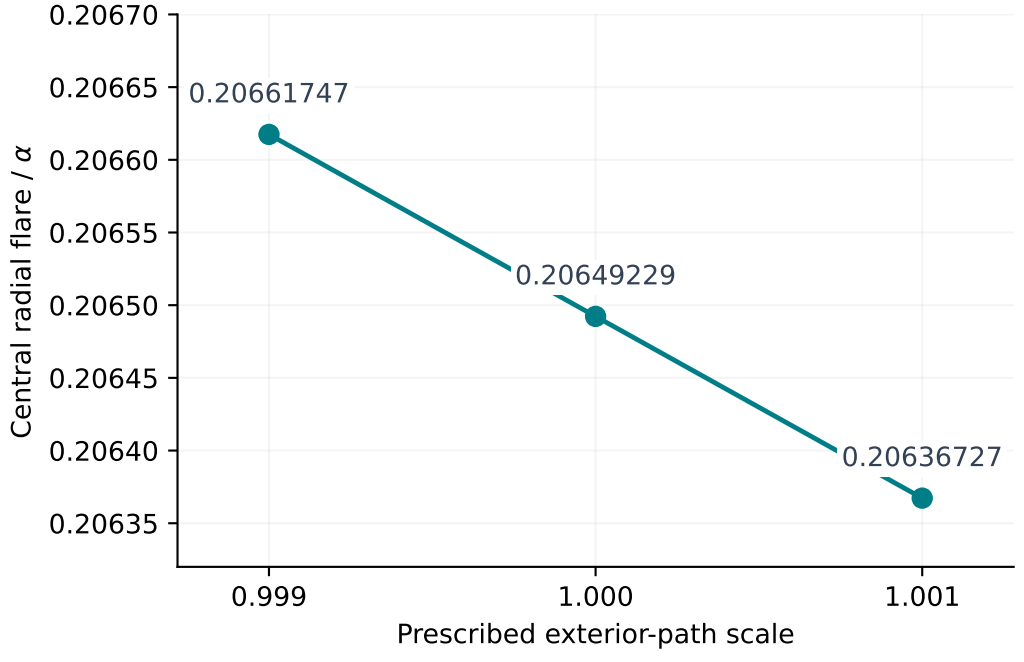
Finite spherical collar + prescribed exterior paths | Common optical units, not clock days

A. One throat pass + one exterior return

Schematic assumed geometry, not a physical blueprint.

Throat crossing takes 4.625× the exterior time.

B. Central opening in the averaged model



Zoomed vertical scale; all three values are positive.

Closed mean-state parameter: w = 1.6194435264

NS spin/Wilson phase is assumed. The ±0.1% path changes are sensitivity probes, not physical uncertainty bounds.

The complete nonradial exterior, state preparation and dynamical stability remain unresolved.

No constructed stable medium or 13 Sep 2027 → 12 Sep 2027 passage demonstrated.
