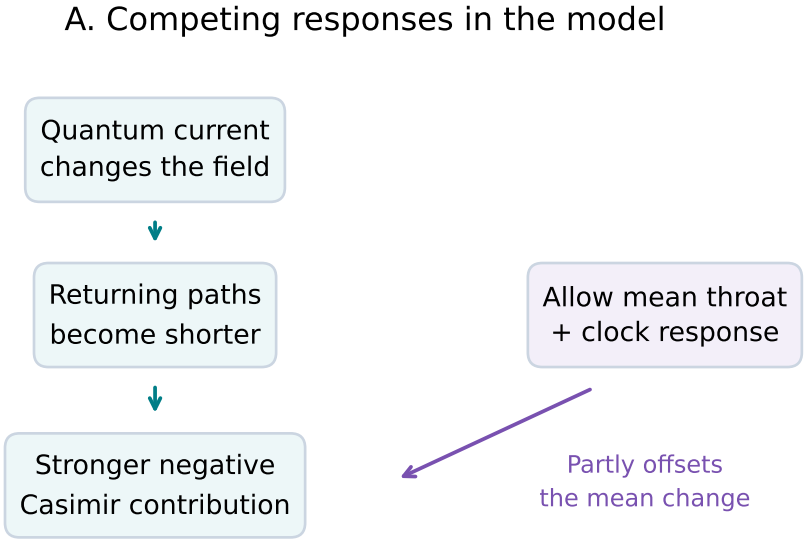
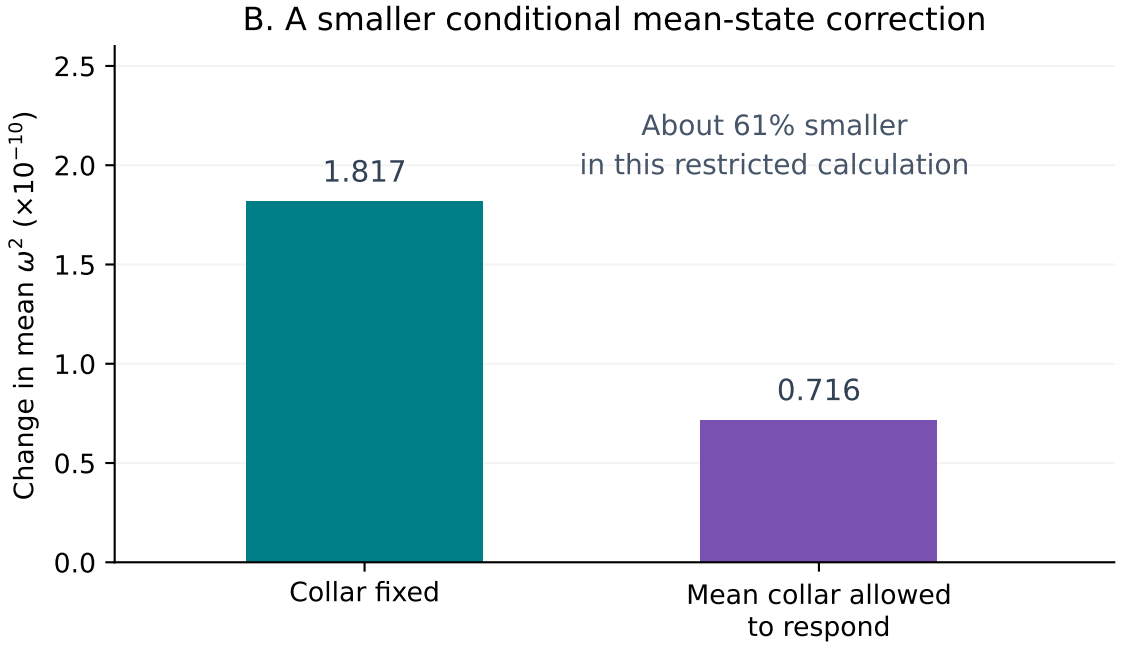
Mean throat and clock response partly offsets magnetic feedback

First static response only • Prescribed flat-region magnetic model • $\alpha = 10^{-9}$





Fixed-flux paths shorten for the prescribed magnetic response.
The additional mean throat/clock adjustment opposes part of it.

Mean correction = fixed-collar forcing / 2.537.
This static comparison does not establish dynamical stability.

Longest channels exceed the perturbative/localized-channel regime; nonspherical metric and interface feedback remain unknown.

No constructed stable medium or 13 → 12 Sep 2027 passage demonstrated.
