Rotation needs energy flow; screening needs boundary data

A fixed-background conservation test and a separate monopole screening calculation

A. Rotating density needs energy flow

Rotate this density alone

Energy balance fails at first order.

↓

Add angular energy flow

First-order balance is restored.

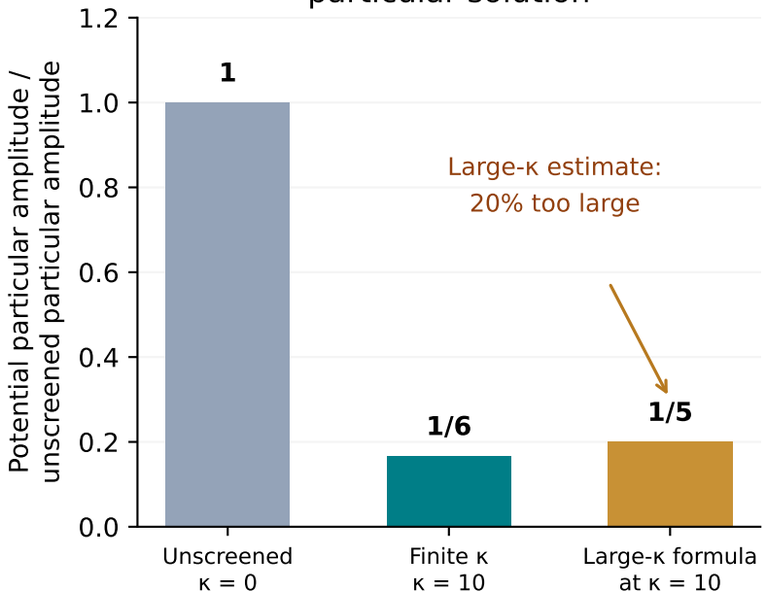
↓

Second-order forces remain

Required stress and charge current are still unresolved.

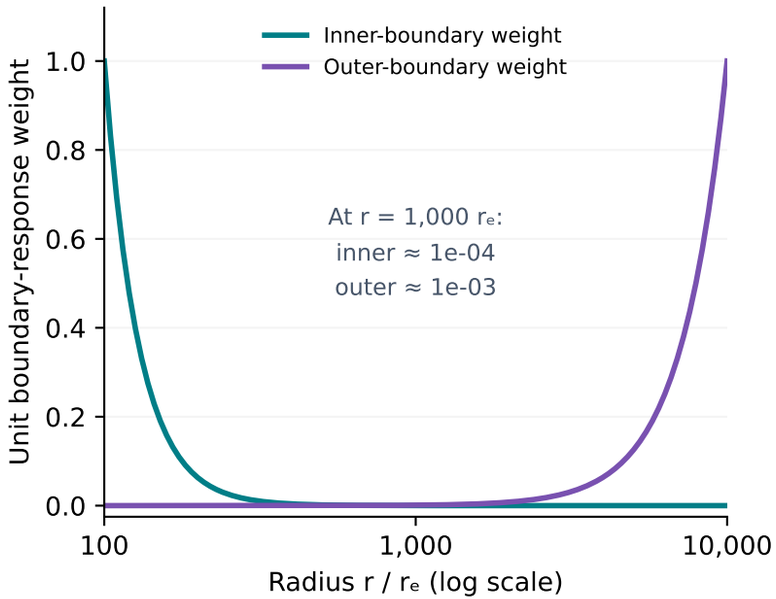
A necessary balance example on fixed RN geometry.
The full charged quantum source has not been constructed.

B. Screening of the particular solution



Ratios of particular solutions, not the full potential.
The 20% error is relative to the finite-κ particular.

C. Physical boundary values are still needed



These are weights multiplying unknown end potentials.
The physical end potentials have not been set to zero.

Source equation: Maldacena, Milekhin & Popov, Appendix G (G.38).

Finite-κ solution, boundary-response weights and conservation checks: our derivations.
