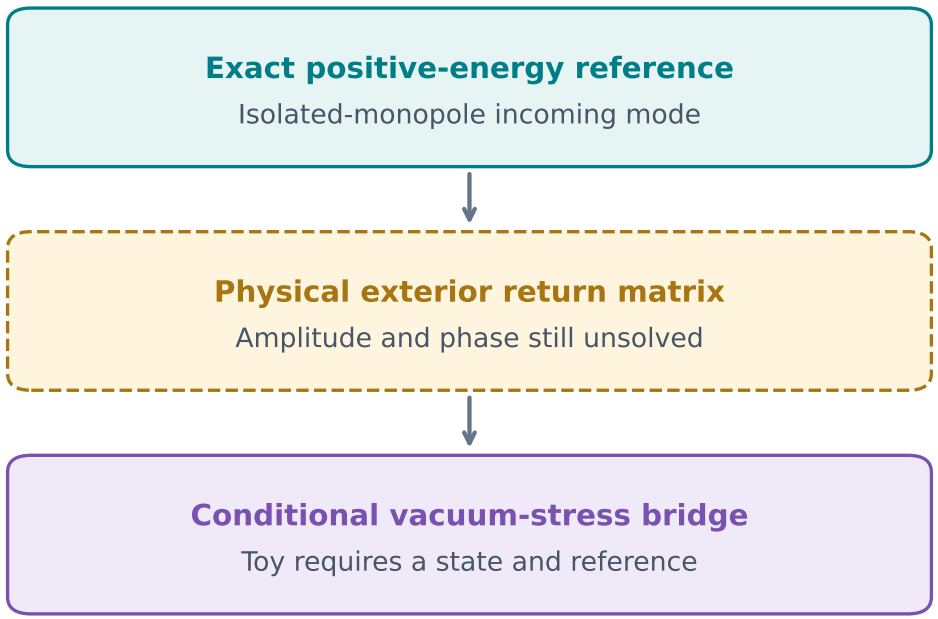
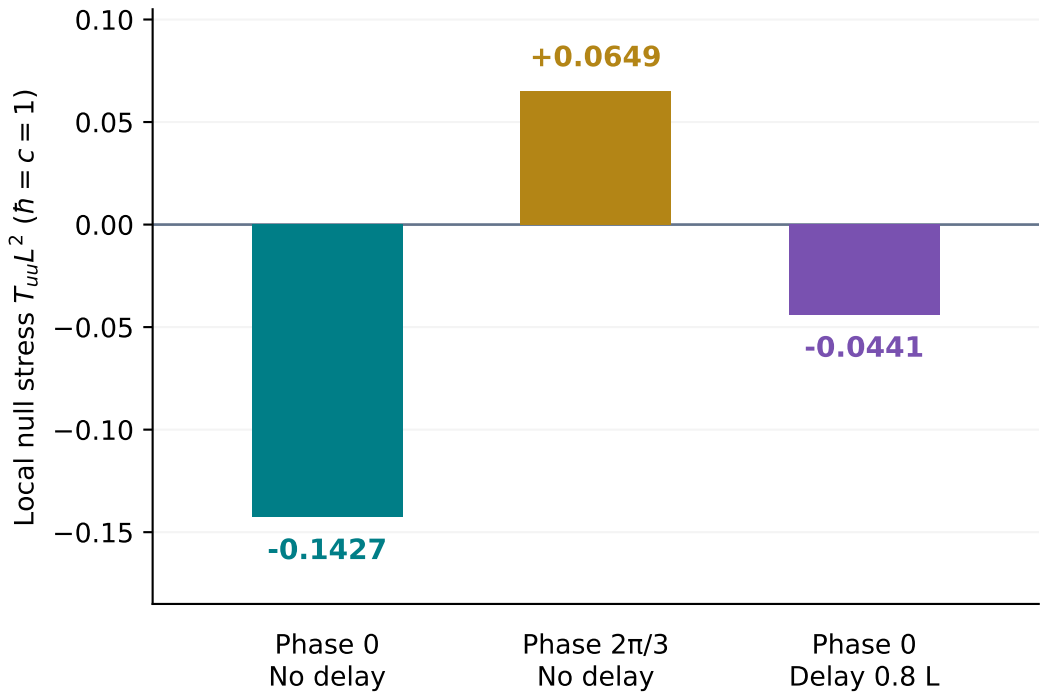
Return probability alone does not determine vacuum stress

Conditional model — no physical medium

A. The missing physical connection



B. Same toy return probability: 25%



Phase reverses the sign; delay changes the magnitude.

The reference input and toy are separate tests; no physical complex return amplitude has been computed.

Toy: a filled reservoir sea, NS loop phase and fixed subtraction. This is not the physical throat stress.

No stable medium or 13 Sep 2027 → 12 Sep 2027 passage demonstrated.
