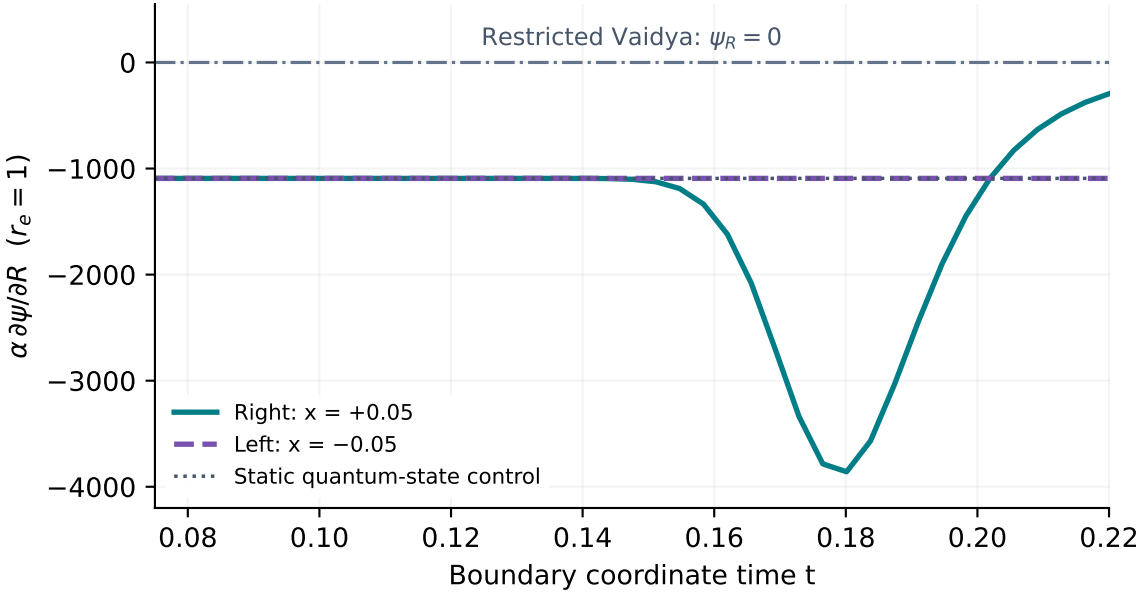
The boundary source requires a radial lapse gradient

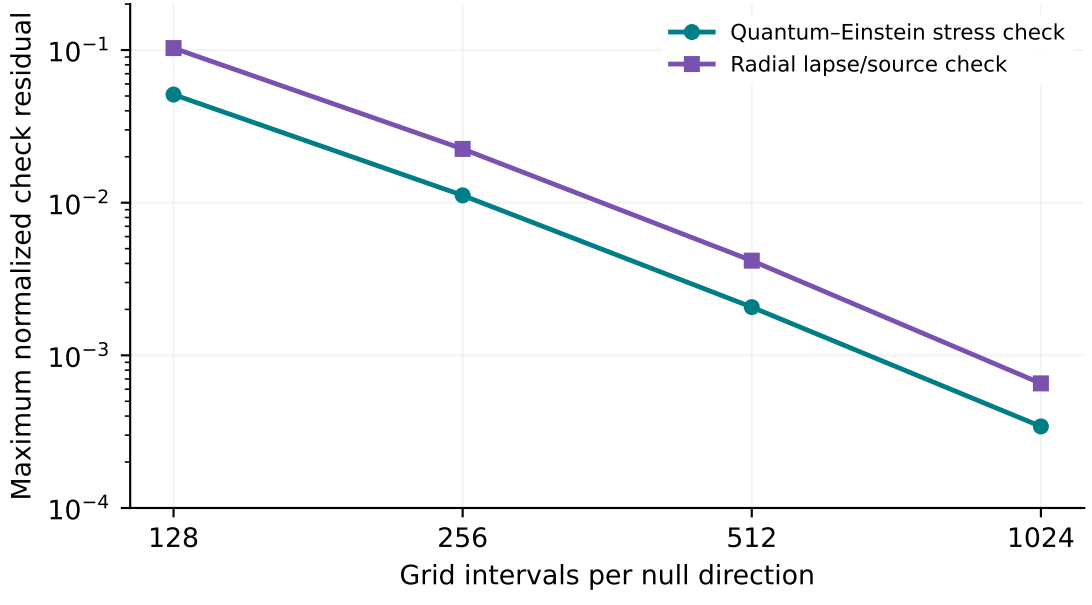
Conditional local model • Pre-existing throat assumed • Boundary values and first derivatives only

A. Required radial lapse derivative



A scaled coordinate derivative, not a measured field.
Static control overlaps the left-boundary trace.

B. Independent source checks converge



At 1024: stress 3.423e-04; lapse 6.552e-04.
Refinement is not a certified continuum error bound.

R is measured in units of r_e; $\alpha = 10^{-9}$. The plotted gradient is required within this specified source and coordinate chart.

Matching first derivatives supplies boundary data. The full exterior, its quantum state, preparation and stability remain unsolved.

No constructed medium or 13 → 12 Sep 2027 passage established.
