A sourced exterior response and a reduced RF spread test

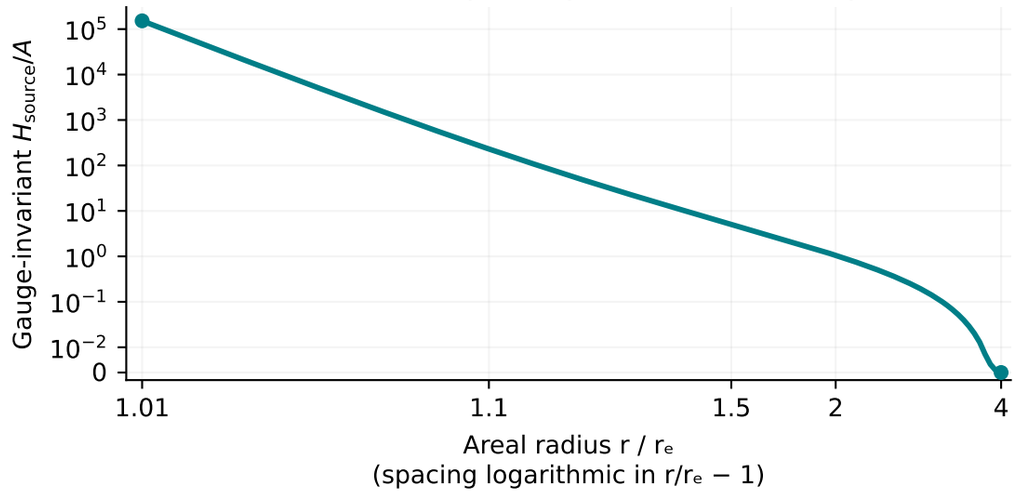

Physical matching remains open • RF results use a turn-averaged model and a separate linear transverse envelope

A. The finite exterior region in this test

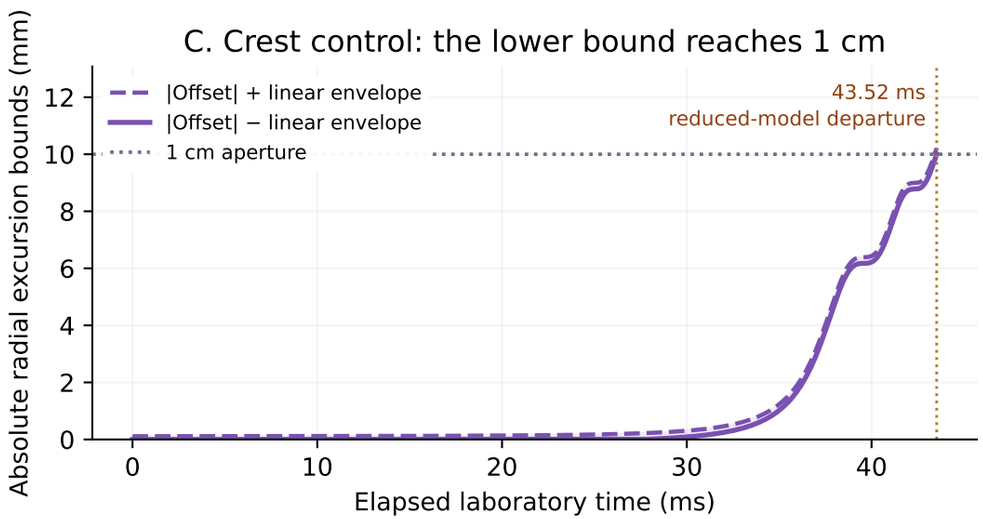

The retained band covers half the flux range.
Missing channels and physical end data have not been set to zero.

B. The additive response per unit source amplitude

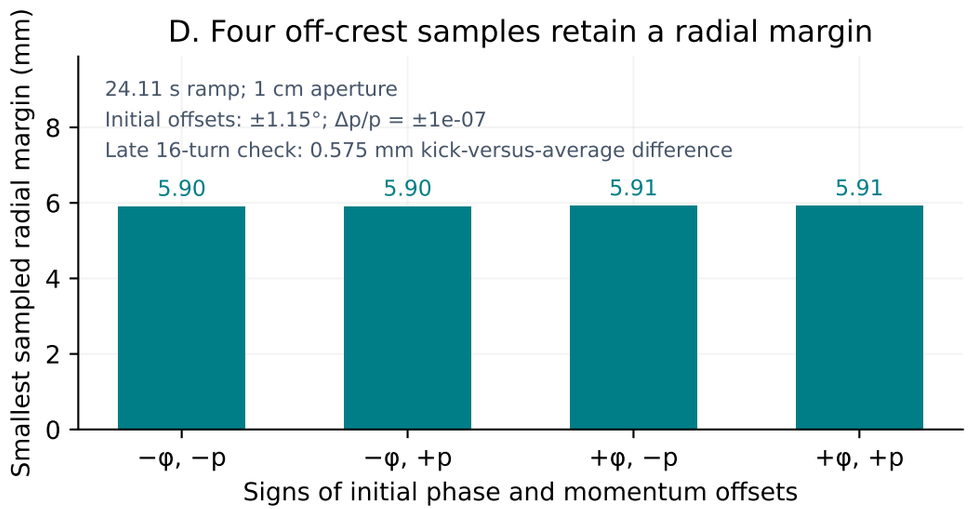

Source column only; the physical end-data response is not included.

C. Crest control: the lower bound reaches 1 cm

The lower-bound crossing implies departure only within this reduced model.

D. Four off-crest samples retain a radial margin

Sampled minima include a linear transverse envelope; this is not whole-beam acceptance.

Exterior: coupled equations include the source within a finite RN region. A full quantum state, physical matching and a stable global geometry remain open.

RF: four reduced-model samples and a crest control. Complete electromagnetic transport, whole-beam acceptance and permanent capture remain unproved.

13 → 12 Sep 2027: unproved. Forward time dilation is supported; no complete human journey has been demonstrated.
