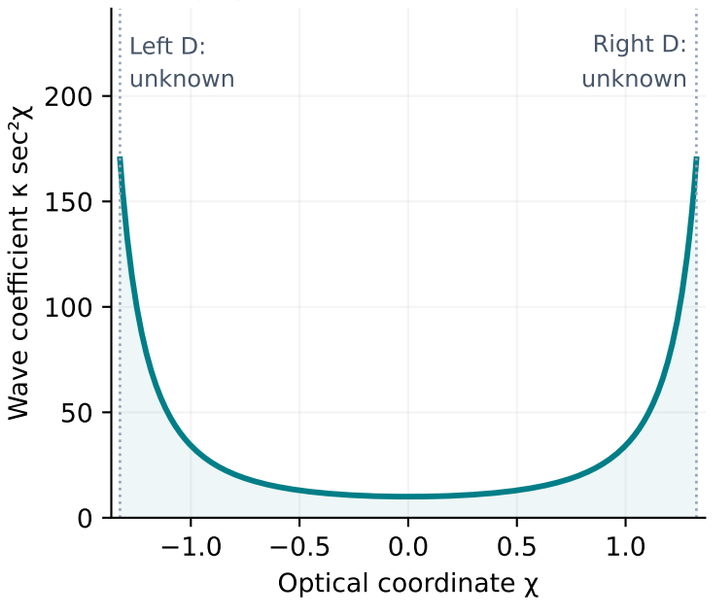
Electric displacement in a prescribed curved throat

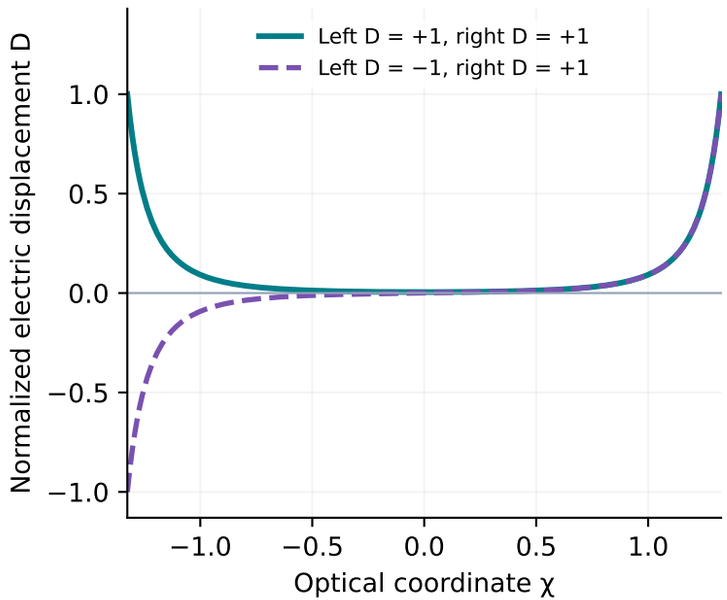
D = electric displacement, not voltage • Spherical charged mode $\ell = 0$ • Fixed leading geometry

A. Curved restoring term; physical end data unknown



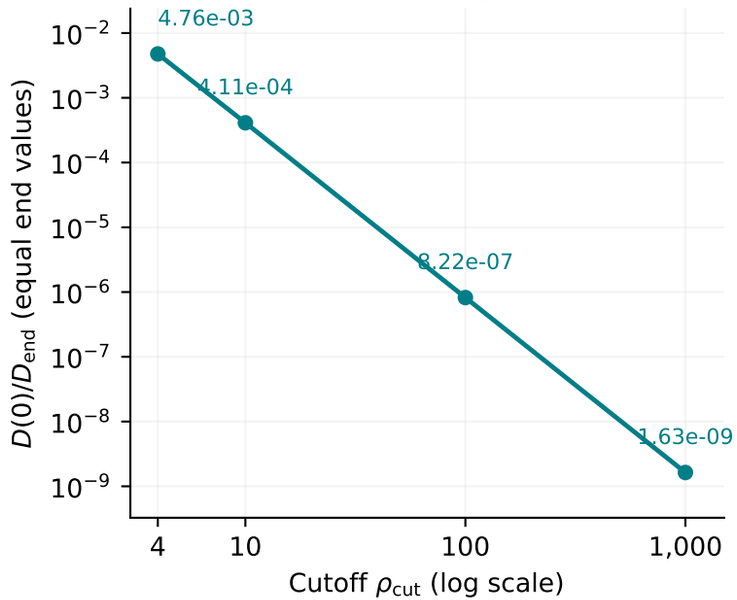
The curve is a wave-equation coefficient, not a voltage.
These finite cuts are not established physical mouth joins.

B. Arbitrary unit boundary values test the static response



The imposed ±1 values are arbitrary test units.
Actual end displacement and its source remain unknown.

C. Equal-end tests at different cutoff positions



A static centre-to-boundary ratio in four saved tests.
This is not a transmission probability or stability result.

Charged collective action: MMP, Appendix A. Finite-cut electric response and checks: our application.

This spherical $\ell = 0$ test does not solve the rotating dipole, physical exterior source or nonlinear metric feedback.

No stable medium or 13 → 12 Sep 2027 passage established.
