The balanced exterior still needs throat matching

Known Emparan Einstein–Maxwell pair in a balancing Melvin field · Existing black-hole horizons remain

White contours are magnetic flux, not particle paths. Masked circles are auxiliary coordinate cuts, not entrances.

D is Weyl coordinate separation, not proper horizon separation. Killing time is normalized on the Melvin axis; infinity is not flat.

The cuts carry angular metric, curvature and gauge data. The earlier spherical collar and flat-exterior return map cannot be reused unchanged.

Next: axisymmetric throat, frame/gauge and Dirac matching. The quantum source, Melvin state and stability remain unresolved.

13 Sep 2027 → 12 Sep 2027 remains unproved; no throat connection, physical medium or construction method is established.
