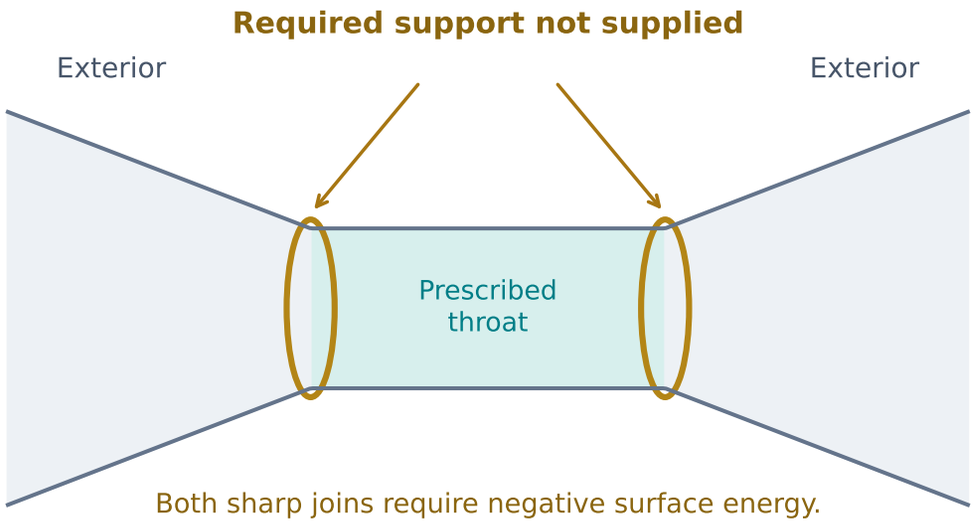
# Curved-mode propagation is calculable; the junction source is still missing

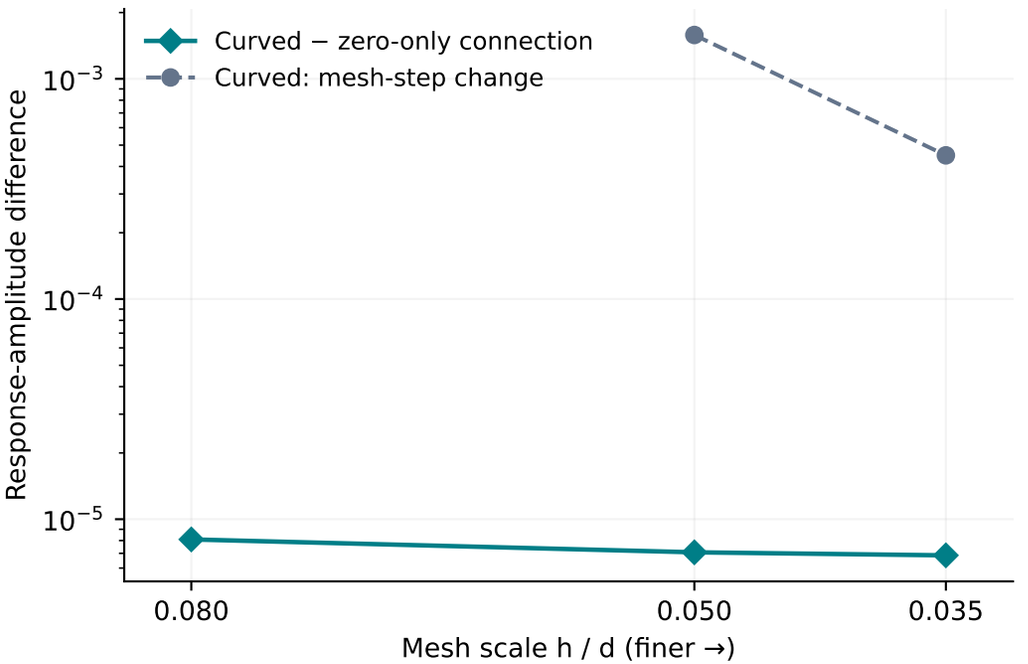
A prescribed throat joined to flat exteriors | Conditional q = 1 field model

## A. Assumed geometry — not an apparatus



Exact normalized requirement: $4\pi G b\,\sigma = -1$.

## B. Conditional model comparison



Imaginary energy κd = 0.4; chosen phase π; not probability.

The smaller mode difference is compared on matched meshes. Refinement changes are diagnostics, not certified errors.

For static spherical smoothing, positive lapse/radius and radius slope 0 → 1 still require negative averaged radial-null stress.

Neither the required material/quantum source nor a complete gravitational solution is supplied by this field calculation.

**No stable medium or 13 Sep 2027 → 12 Sep 2027 passage demonstrated.**
