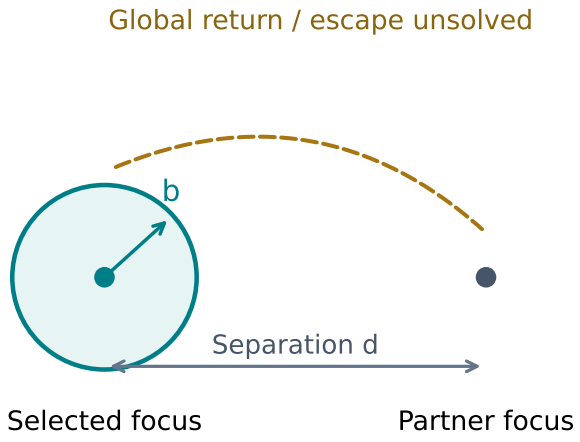
Correcting the local collar mode reduces its Dirac residual

Flat point-pair model | q = 100,000 | A local mathematical test

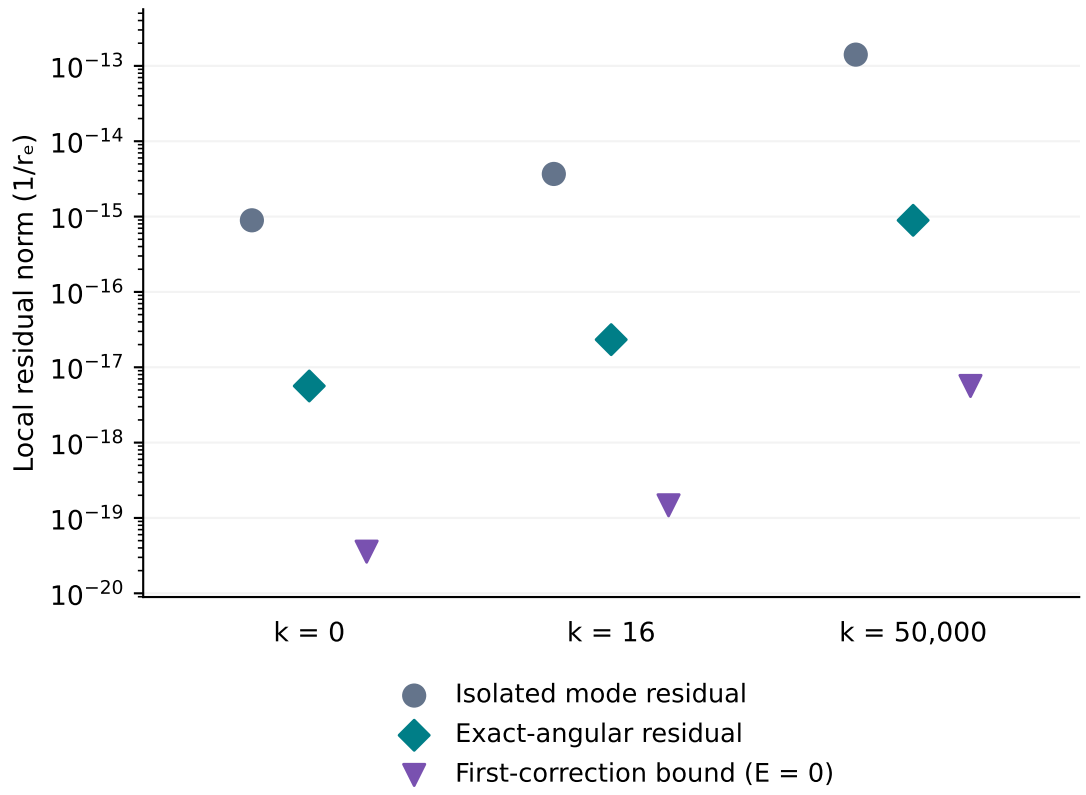
A. Local collar only — schematic, not to scale



Angular solution valid inside 0 < b < d

Saved collar: b/d = 2.36 × 10⁻⁸

B. Local residuals and an upper bound



E = 0 isolates the derivative correction; a finite-energy input adds an energy-dependent term to the bound.

Small local residuals do not establish transport accuracy, global return, escape or a stable medium.

Model calculation, not a new physics discovery. 13 Sep 2027 → 12 Sep 2027 remains unproved.
