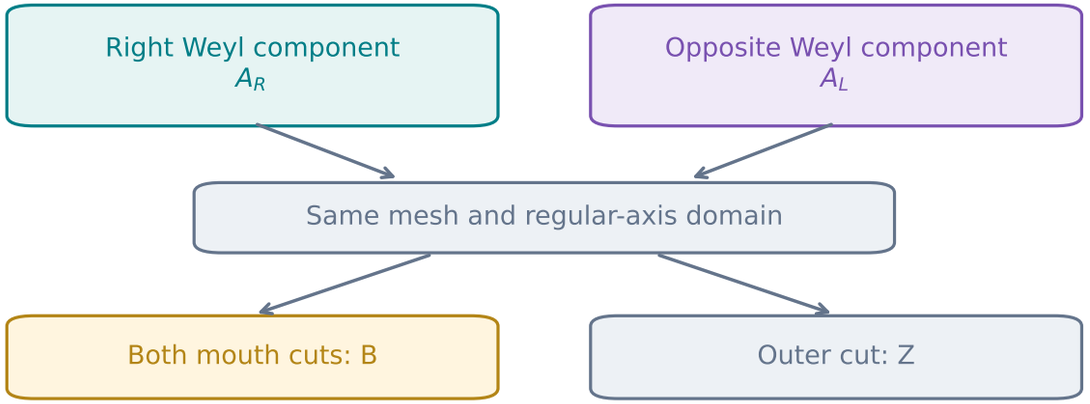
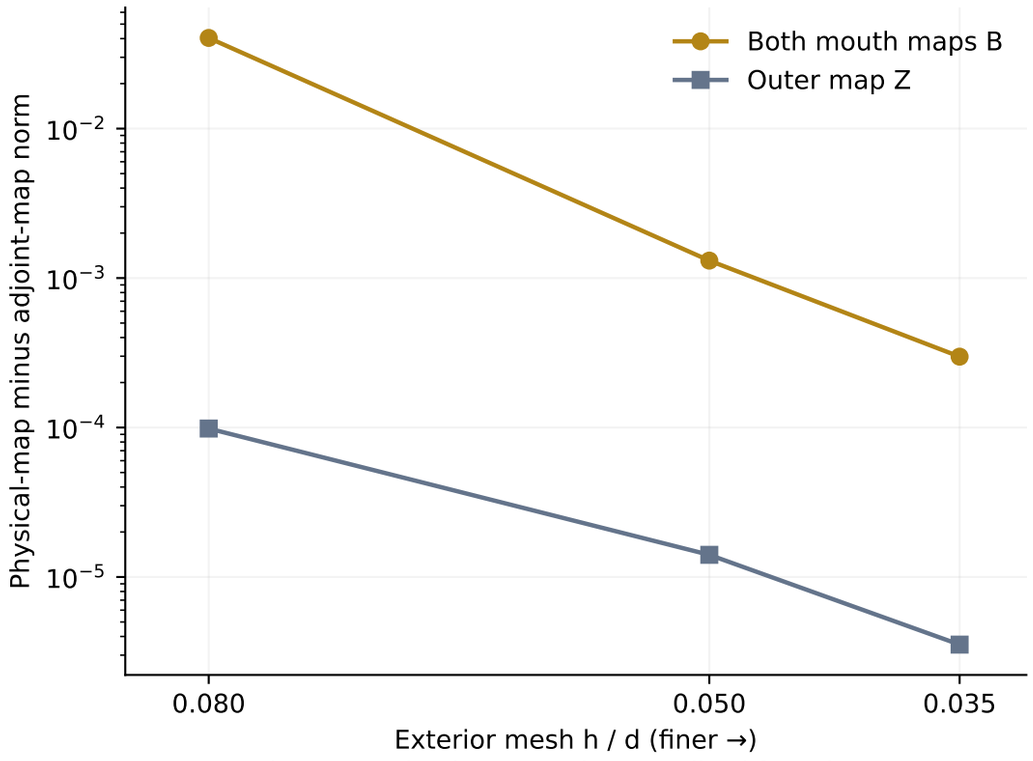
The two Weyl components need consistent boundary maps

Independent opposite transport · Actual two-component integrals · One retained azimuthal sector

A. Two components share one domain



B. Boundary-prescription differences



κd = 0.4; Frobenius norms in normalized facet bases.

Computed paired PHASE contrasts

Probe	Energy + radial pressure	Radial flow (numerical residual)
Central probe	-0.15541	2.71e-10
Upper-side probe	-0.059658	1.04e-10

h/d = 0.05; raw weighted responses. Residual flow is mesh-sensitive.

Independent transport adjoint residual: 1.2e-15 relative. Deliberately adjoint-paired exterior control: 2.9e-15 in norm.

Normalized units $\hbar = c = d = 1$; integral window 1e-06 ≤ κd ≤ 12. Boundary maps: three imaginary energies.

These finite prescriptions remain distinct. Continuum bounds, the full Dirac source and physical throat support remain unresolved.

No stable medium or 13 Sep 2027 → 12 Sep 2027 passage demonstrated.
