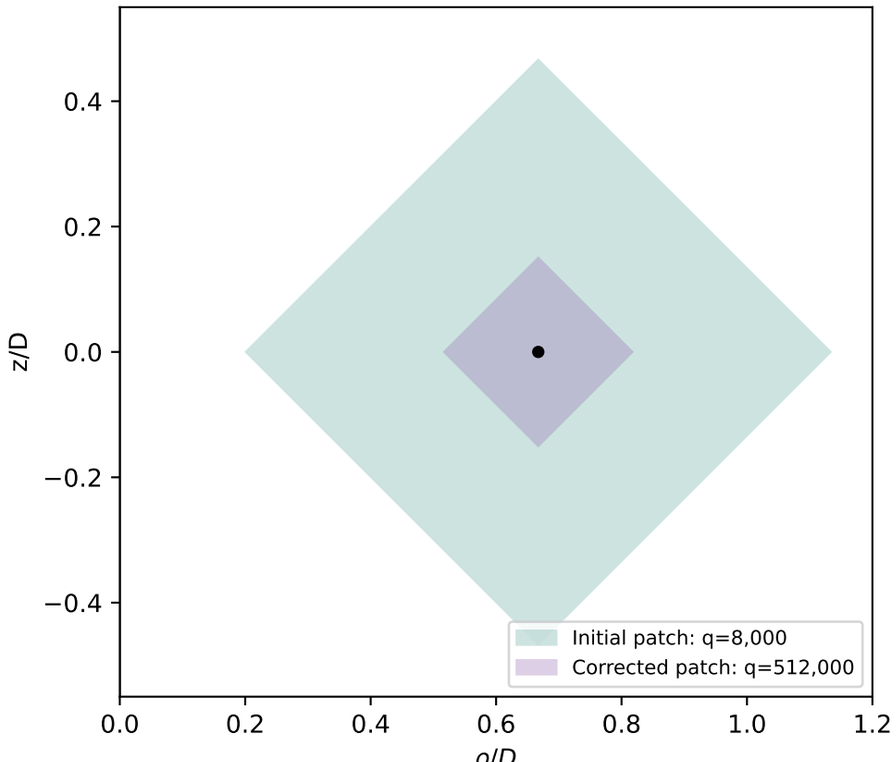
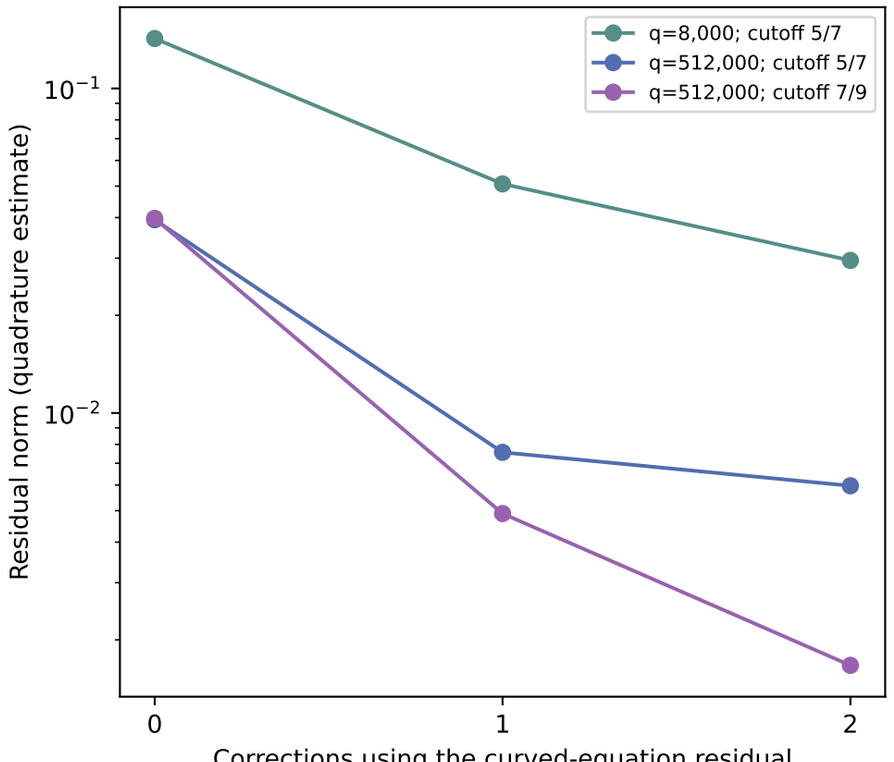
From the ideal saddle to the actual curved coefficients | A numerical matching step

Trial support inside the curved exterior



Check every correction in the actual equations



What improved

Curved metric, gauge field and quantized mode are included in the differential equation.

Two corrections reduce the selected residual from 0.03978 to 0.001669 (about 24-fold).

What the check does not prove

Quadrature agreement is not an interval certificate.

The exterior operator domain still needs completion.

No supporting quantum stress or stable throat.

No physical material or backward passage.

Source cutoff stays fixed when the trial is widened.
