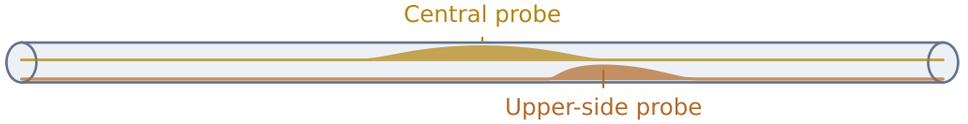
Long-throat source: finite-window integrals

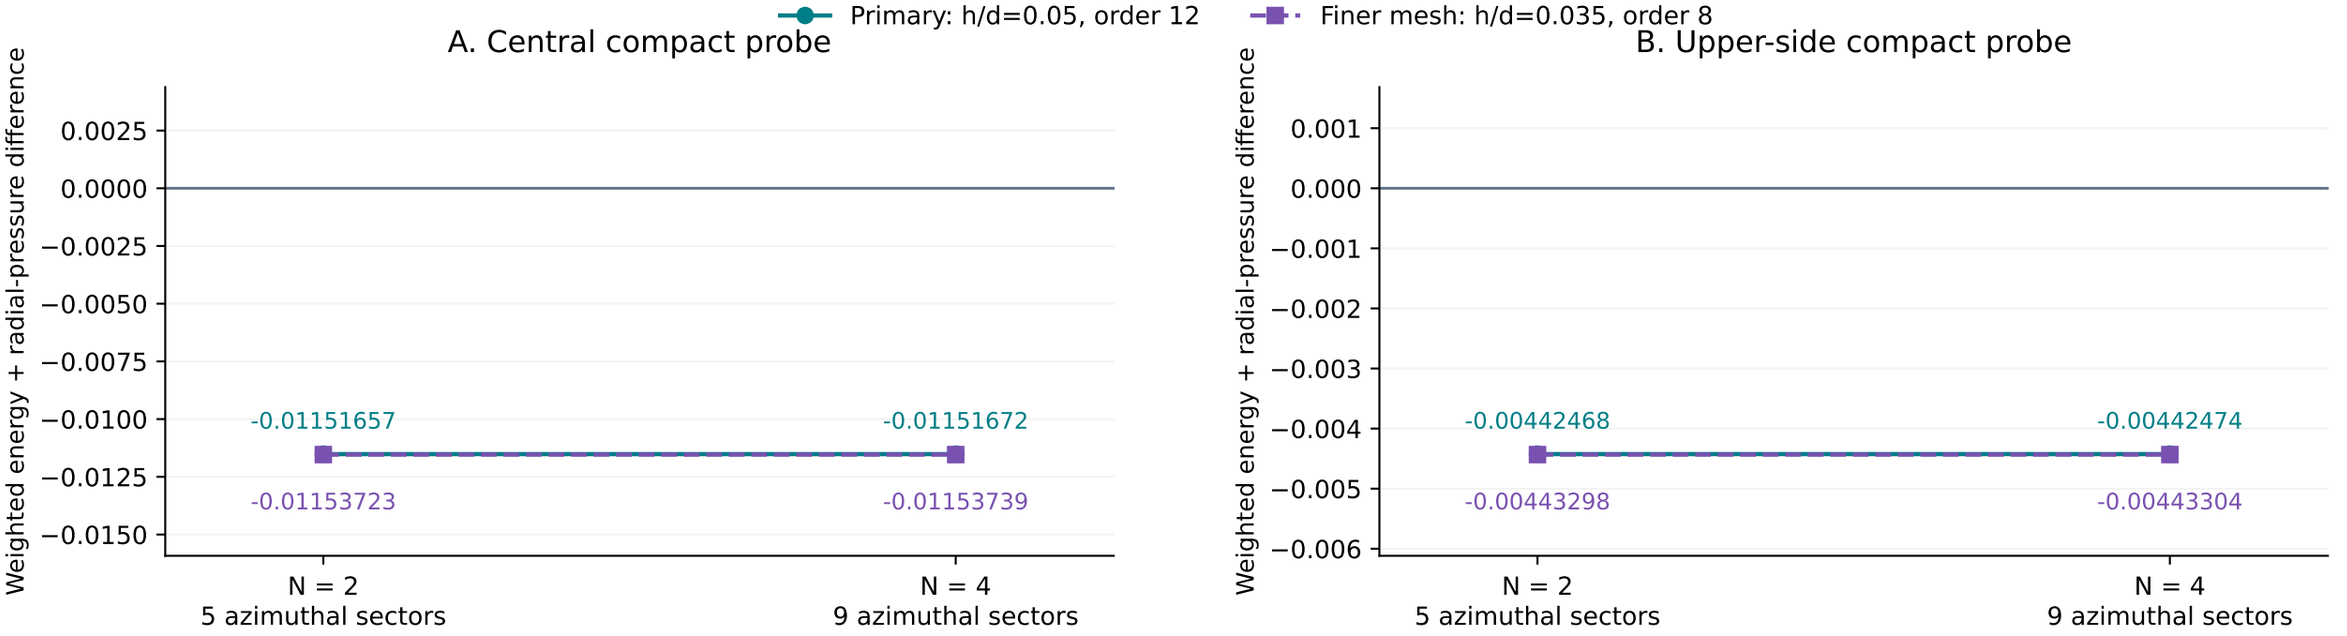
Phase π · Connected minus invariant AdS reference · Same prescribed geometry for both angular cuts

ρc = 32; b = 0.2d | Proper length = 1.6637d | Optical length = 19.7159d | Center lapse = 0.03123

Prescribed constant-radius core
Profiles versus proper distance



Assumed geometry;
sharp joins remain unsupported



All m = −N,...,N at each finite mouth cutoff; outer J = 9 fixed. Both Weyl components; $\hbar$ = c = d = 1.

Finite window 1e-06 ≤ x = κℓ ≤ 48; integrands Qκ/ℓ use dx weights. This is not the infinite-frequency source.

N=2 → 4 changes: -1.55e-07 central, -5.9e-08 upper. N=4 matched-order mesh changes: -2.07e-05, -8.3e-06.

N=4 frequency-panel sensitivity: 1.5e-09. These observed changes are not error bars or certified continuum/tail bounds.

Phase 0 has positive N=4 primary values. Full angular/frequency limits, physical support, junctions and stability remain open.

No stable medium or 13 Sep 2027 → 12 Sep 2027 passage demonstrated.
