Whole-plane local Dirac model | A controlled response, not a time-travel medium

One smooth field, including the corners

Continuum error, including omitted modes

What this establishes

A whole-plane response to one Gaussian probe.
No overlapping exterior pieces or remote caps.
The full equation residual controls the error.

$\kappa = 0.5$: Im G = 0.471489286
Certified scalar error radius: 4.09e-06
For this fixed probe and ideal saddle model.

Still missing

Curved-geometry matching and local-model error.
The full quantum stress and gravitational support.
A stable throat or backward passage.
